Abstract

This report summarizes the data and program highlights for the 2017 field season of the Adirondack Watershed Institute's (AWI) Stewardship Program of Paul Smith's College (PSC) located in Paul Smiths, NY. In 2017, the AWI hired 119 watershed stewards stationed at 62 different boat launches and 16 decontamination stations throughout the Adirondack Park and beyond. This allowed the AWI to implement a landscape-scale, coordinated aquatic invasive species (AIS) spread prevention program. Boat inspection and decontamination programs managed and funded by cooperating lake associations placed 25 stewards at 9 additional locations, for a combined total of 144 stewards at 67 launches and 20 decontamination stations. Under a contract with the New York State Department of Environmental Conservation (NYSDEC), the AWI managed the New York State AIS Prevention Program, funded by an appropriation from New York State's Environmental Protection Fund, for the third consecutive year. The AWI has stationed watershed stewards funded by a variety of agencies and foundations across the Adirondack Park since 2000.

AWI stewards educated 170,689 visitors about AIS issues and spread prevention techniques while inspecting 83,063 watercraft. Stewards discovered and removed 3,788 confirmed AIS, encompassing 3.8% of all watercraft inspected. Partner programs were operated independently at Brant Lake, Canada Lake, Caroga Decontamination Station, Loon Lake, Paradox Lake, Northern Schroon/Paradox Decontamination Station, Town of Horicon Decontamination Station, and Schroon Lake. With partner programs' inspection figures included, total numbers for 2017 are 97,412 watercraft inspected, 202,766 people educated, 3,849 confirmed AIS removed from watercraft, and an overall watercraft AIS transport rate of 3.3%.

A comparative analysis of data from 67 AWI and partner program boat launches revealed variation in visitor reception to inspection, AIS transport rate, percentage of visitors taking AIS spread prevention measures, and types of watercraft launched. Visitors reported using their watercraft within the previous two weeks on over 620 different water bodies throughout the United States and Canada.

This report also includes summaries of steward outreach projects and research that took place during the 2017 field season. Steward projects include public education and outreach, community involvement, research projects, and projects surveying, managing and monitoring invasive species.

In 2017, funding for the AWI was provided by the United States Environmental Protection Agency Great Lake Restoration Initiative (EPA GLRI), the New York State Environmental Protection Fund, the Upper Saranac Lake Foundation (USLF), the St. Regis Foundation, the Lake Placid Shore Owners' Association (LPSOA), the Rainbow Lake Association, the Great Sacandaga Lake Advisory Council, the Great Sacandaga Lake Association, the Lake Champlain Basin Program (LCBP), the Black Lake Association, the Towns of Arietta, Horicon, and Lake Pleasant, and Paul Smith's College.

Morning fog at Buck Pond

Introduction

Eric Holmlund, PhD
Director, Adirondack Watershed Institute Stewardship Program

The AWI and the Stewardship Program

The Stewardship Program is the education, outreach and spread prevention arm of the college's comprehensive environmental science, education, and management institute, the Adirondack Watershed Institute (AWI). The AWI is the only organization in the Adirondack Park offering a full range of environmental services including general environmental science, water quality monitoring, fisheries program management, aquatic invasive species (AIS) monitoring, ongoing AIS infestation management, AIS infestation rapid response, large-scale public outreach, data analytics and support services, and AIS spread prevention. AWI staff members coordinate and maximize the impact of AIS prevention, management and response activity by sharing information between the complementary aspects of the program.

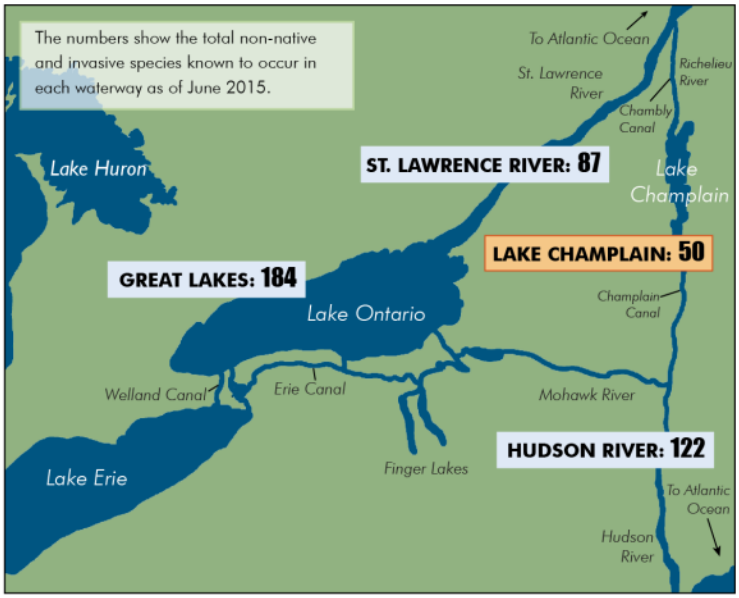
The Stewardship Program initiated services in 2000 on one northern Adirondack lake chain, the St. Regis Lakes, and has since expanded its coverage to nearly 70 locations across the entire North Country region. Our 2017 field season featured boat inspection and outreach from Glens Fall in the southeast to Wilson Hill on the St. Lawrence River in the northwest, and from Old Forge in the southwest to Plattsburgh on Lake Champlain in the northeast.

The AWI embodies the threefold mission of the AWI—(1) researching terrestrial and aquatic ecosystems and the impacts of human activity on the natural environment, (2) enhancing the education of PSC students, and (3) engaging the communities of the Adirondacks in stewardship of natural resources—by directing scientific, educational, and spread-prevention resources to address the persistent ecological and social challenges wrought by the spread of aquatic invasive species. The AWI pursues this mission through a highly collaborative strategy, sharing resources, support and expertise with communities, municipalities and state and federal agencies across the Adirondack region. The AWI collaborates with a steering committee for regional AIS prevention, coordinated by the Adirondack Park Invasive Plant Program, and comprised of representatives from local government, environmental organizations, lake associations, New York State DEC, NYSDOT, the Lake George Park Commission, and the Lake Champlain Basin Program. In a region as large and jurisdictionally complex as the Adirondacks, the AWI recognizes that strategic partnership is the most effective path forward to forge truly effective and enduring responses to the landscape-level disruption posed by the spread of invasive species.

The Adirondack Region and the Threat of Aquatic Invasive Species

The Adirondack Region is home to globally significant wetlands, thousands of lakes and ponds, and over 30,000 miles of rivers and streams. With an abundance of high quality water resources, the Adirondacks present a crucial opportunity for stewardship. The Park protects almost six million acres of forests, mountains and waterways, attracting hundreds of thousands of visitors and seasonal residents annually. Most prominent among the many attractions of the region are its opportunities in snow-free months for aquatic recreation, including paddling, sailing, motorboating, swimming, diving, camping, and fishing. Visitors to the Adirondack Park expend $1.2 billion annually, with nearly 70% expressing an interest in water based recreational activities such as swimming, fishing or boating (Kelting, 2006). While productive from a socioeconomic perspective, many of these activities can, and have, spread AIS over the past two decades to over 100 Adirondack lakes.

The threat, impact, and mechanisms of AIS infection have been well documented. A 2010 Notre Dame University paper confirmed and quantified the role of recreational watercraft and trailers in spreading AIS overland between waterbodies (Rothlisberger, Chadderton, McNulty, & Lodge, 2010). Previous research has shown that zebra mussels are dispersed when they are attached to aquatic vegetation entrained on boat propellers and trailers (Johnson, Ricciardi, & Carlton, 2001). New AIS continue to make inroads in NYS each season, including continued, mounting infestation of Asian clam (*Corbicula fluminea*) in Lake George, expanding to a total of 23 sites in 2017, detection of spiny waterflea (*Bythotrephes longimanus*) in Indian Lake in 2016, along with the continued management of *Hydrilla verticillata* in Cayuga Lake, Tinker Pond, Prospect Park Lake, Erie Canal, Creamery Pond, and the Lower Croton River. While the Adirondack Park has 103 waterways infested with six aquatic invasive plant species and three aquatic invasive animal species, it is surrounded by highly visited waterways with dozens more AIS not yet present in the region (Smith, Quirion, & Johnstone, 2013). AIS spread prevention programs are an integral component of an effective invasive species management regimen. Stewardship/ watercraft inspection programs help reduce the inadvertent introduction of new AIS to the Adirondacks, including species such as Brazilian elodea, hydrilla, quagga mussel, and round goby. Although the threat of AIS introduction and expansion justifies alarm, there are hundreds of waterways in the Adirondack region with few or no AIS at present, which underscores both the opportunity as well as the obligation for concerted, coordinated AIS spread prevention activity.



DATA SOURCE: UVM, LCBP, Lake Champlain Sea Grant, Great Lakes Environmental Research Laboratory, Lafontaine and Costan 2002, and Strayer 2012. Lake Champlain data current as of 2014.

In 2017, however, the APIPP-sponsored AWI rapid response team detected NO new invasions of Adirondack Lakes, the first time that this has happened in over a decade. This is certainly welcomed news, which presumably is a result of the heightened awareness of AIS spread measures and the widespread boat inspection and decontamination program run by AWI and partners.

AWI Stewardship Program Growth

Director Eric Holmlund and LCBP AIS coordinator Meg Modley presented an analysis of the historic development of the Adirondack Spread Prevention program at an international conference in Flordia. We drew a parallel between the commonly understood cultural and management response curve to AIS invasions[1] and the actual response curve we have experienced in the Adirondack Park. The essence of the so-called Invasion Curve is

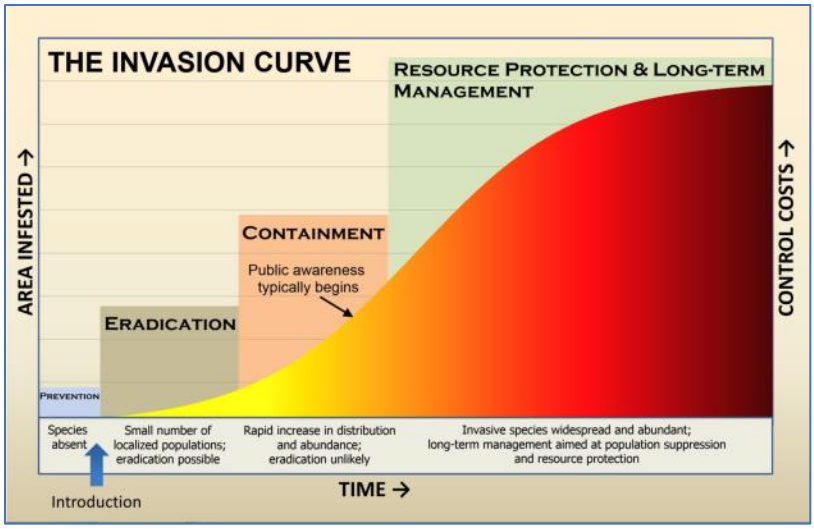


Figure 1: The Invasion Curve

[1] Harvey, R., and Mazotti, F. The Invasion Curve: A Tool for understanding invasive species management in South Florida. University of Florida IFAS Extension, document WEC347. 2014.

that response options lag behind the actual invasion and propagation of invasive species. Invasive species are often documented only after they have been established in such numbers that they become detectable. The window of opportunity to eradicate new infestations can close all too quickly, leading to management response goals of containment or eventually, population suppression.

We characterized the growth of the AIS prevention efforts in the Adirondack region as a similar curve, reflecting growing awareness, social capital and resources applied to the problem. We identified four distinct phases in program growth, from an early era of comparatively miniscule public awareness and only private sources of investment underwriting only a handful of seasonal watercraft inspectors. The implementation of the Obama Administration's Great Lakes Restoration Initiative in 2010 led to our first dramatic increase in funding in the summer of 2011. This allowed us to station watercraft inspectors at important locations in the Lake Ontario Headwaters. In 2014, we began high-impact collaboration with state agencies, local municipalities, the business community, and the association of towns and villages in the Adirondack Park. A combination of private advocacy and NYS Agency awareness led to the implementation in 2015 of the first year of the NYS funded Adirondack AIS prevention program.

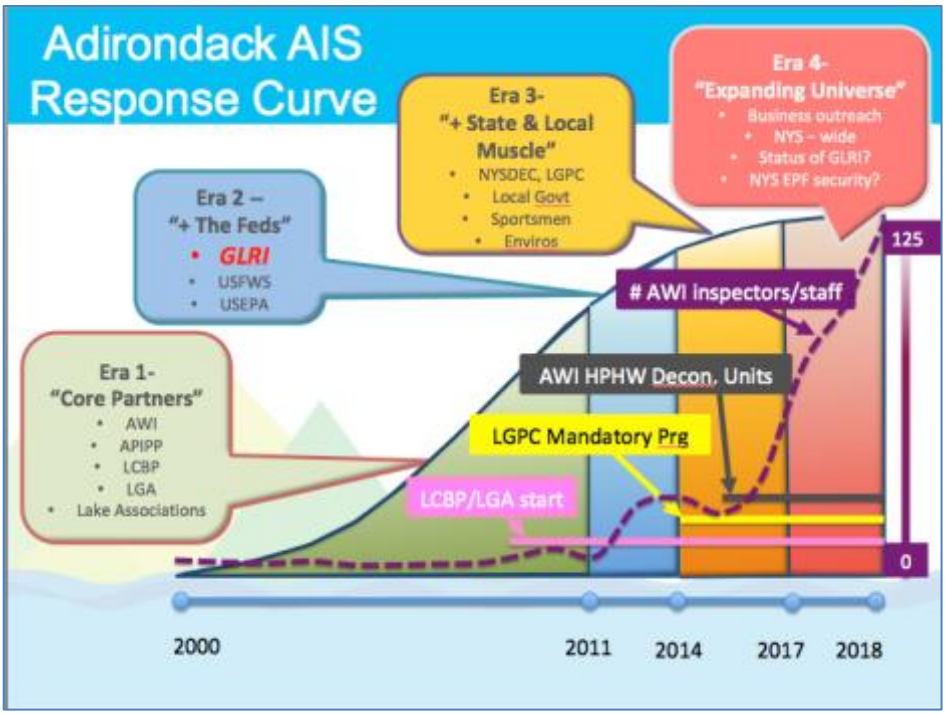

Figure 2: Growth of Adirondack AIS Prevention Program

We are currently in a fourth era, wherein New York State funding for a regional spread prevention program is becoming normalized and extended over a contract period of five years. This continuity will be essential in the management community's ability to offer a stable and effective program across the Adirondack region. Federal sources are being scrutinized and tightened under the Trump Administration's reforms, leading us to work ever more closely with our partners in state and local government.

Our conclusion is that a *landscape-scaled program* that responds to a *landscape-scale threat* is essential – smaller lake-specific programs will ultimately pale in effectiveness compared to a well-resourced, data-driven, regional program which allows for greater uniformity in programming, protocol, and the ability for program administrators to compile and analyze data from around the region and state.

Program Elements and Scope

The 2017 field season of the AWI saw yet another increase in scope over the program's record year of 2016. A record 125 AWI stewards and staff (up from 92 in 2016), supported by a budget of well over $2 million, delivered an integrated AIS spread prevention program at nearly 70 separate locations in all regions of the 6,000,000-acre Adirondack Park. The AWI administered a composite budget derived from over one dozen sources, including two contracts with New York State, Great Lakes Restoration Initiative awards from the US EPA, support from the Lake Champlain Basin Program, and contracts with several lake associations, foundations and municipal entities. The AWI coordinated the local and regional imperatives of each funding source and stakeholder group into an integrated, regionally coherent program. In addition, the AWI combined efforts with a range of administratively separate AIS spread prevention programs including those offered by the Lake Champlain Basin Program, the Lake George Park Commission and a number of Adirondack lake associations including the Schroon and East Shore Schroon Lake Associations, Loon Lake Association, Town of Caroga, Canada, Brant and Paradox Lake Associations.

Invasive spiny waterflea sampled from Indian Lake

The AWI's 2017 field season featured the third year of the Adirondack AIS Prevention Program, a New York State-funded initiative to deploy and staff decontamination equipment at 16 decontamination stations and dozens of boat inspection stations sited strategically around the Park. The AWI worked closer than ever with the Adirondack Park Invasive Plant Program and New York's Department of Environmental Conservation's Invasive Species Unit, Albany DEC staff, The DOT, the NYS Department of Fisheries, and Regions 5 and 6 staff to plan, troubleshoot, and monitor the enhanced and expanded AIS spread prevention program. AWI watercraft inspectors were trained to use high-pressure hot water decontamination equipment on high- risk boats failing New York State's "arrive clean, drained and dry" standard. Watercraft inspectors at 62 inspection locations at boat launches across the Park were able to refer high-risk watercraft to nearby decontamination facilities, thereby providing the greatest degree of access to boat decontamination in the Adirondack Region yet.

Zebra mussels crusted underneath a pontoon boat

Also noteworthy for 2017 is the continuation of the AWI's role in supporting the data intake and analysis efforts of developing lake steward/boat inspector programs across the state. The AWI has been asked by lake associations and other entities administering boat inspection programs to share its model and format for collecting and analyzing data. To this end, we have provided tablets loaded with survey software to collaborators across the state, and then download and distribute results to program administrators. In addition, we have compiled and performed routine analysis of data for several of the collaborators as a service to the community. We provide this service to a number of Adirondack programs, including Blue Mountain Lake, Schroon Lake, Loon Lake, Paradox Lake, Brant Lake, Canada Lake and Caroga Decontamination Station, as well as other New York State programs including

Chautauqua Lake, Cassadaga Lake, Keuka Lake, and Lake Moraine. The reports of our Data Analysis Support Services can be found in one of the appendices. This service allows the AWI to access and incorporate data from programs all across the state, allowing the AIS management community to better coordinate and synergize AIS prevention efforts..

Overview of the 2017 report

This report contains chapters and components summarizing the program's findings, activities and diverse functions. The Program Description chapter provides an overview of the scope, training, and methods employed by our watercraft inspectors. The Summary of Results chapter presents and interprets composite data and results obtained by watercraft inspectors and decontamination station operators for the 2017 field season, including analysis of the AIS spread vectors determined from the analysis of previously visited water bodies. The Program Discussion chapter provides descriptions, discussion, and recommendations pertaining to the two largest elements of the 2017 program: the Great Lakes Restoration Initiative and the Adirondack AIS Spread Prevention Program, funded by New York State.

The report continues with summaries and results from approximately 20 distinct environmental education, outreach, and stewardship projects conducted by seasonal staff to augment and extend their primary function as watercraft inspectors. The longest section of the annual report is comprised of 42 three-page Location Summaries, which provide condensed summaries of data, maps, and results for the primary locations of watercraft inspection and decontamination stations. These summaries will be useful snapshots of watercraft inspection program outcomes for those interested in particular water bodies and locations. They include summaries for our data support service lakes. The report concludes with appendices detailing our seasonal staff and listing the education and outreach events conducted and attended by our seasonal staff.

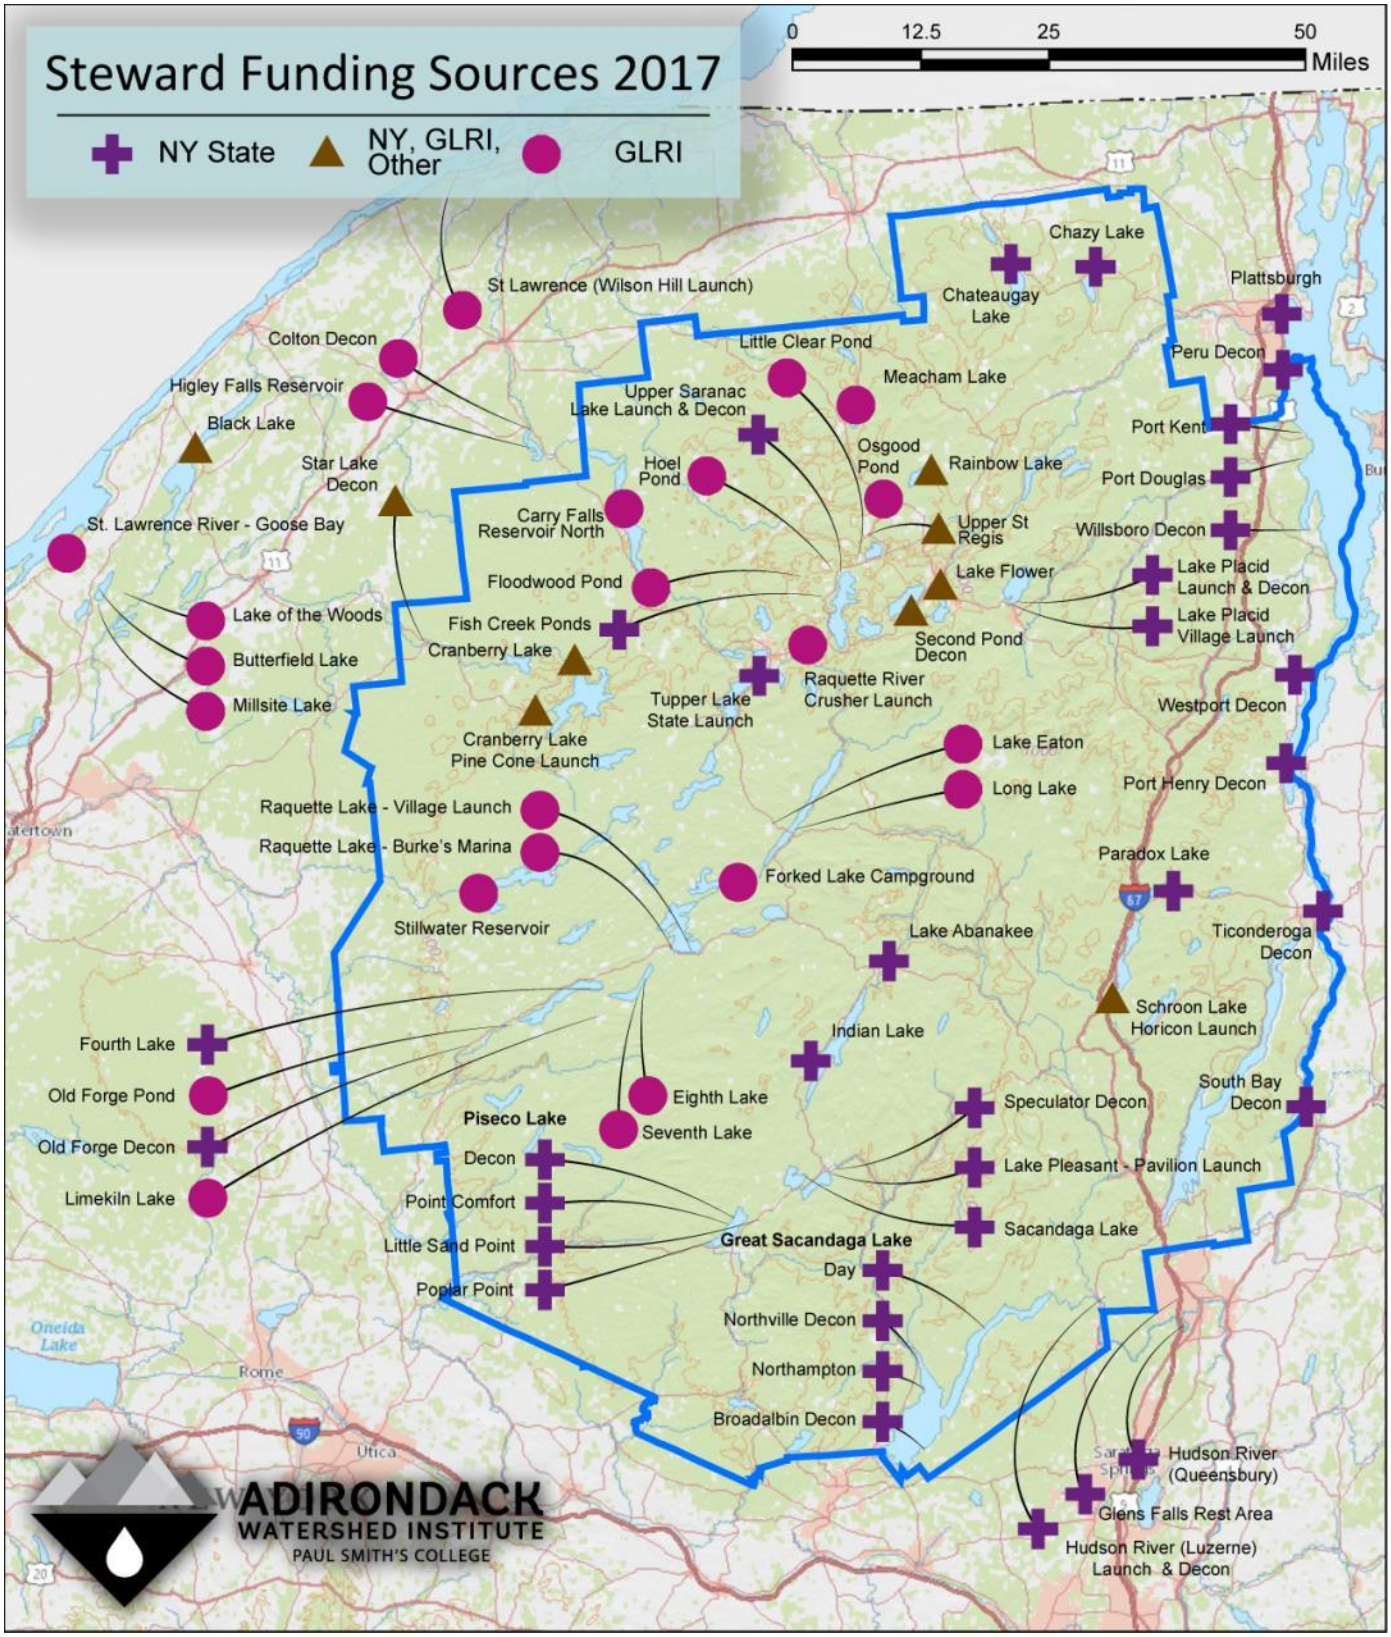

Figure 3. Overview map of AWI steward locations and funding sources (excludes partner programs).

Program Description and Methods

Sue O'Reilly
Data Manager, Adirondack Watershed Institute Stewardship Program

Program Background

The Stewardship Program is the public education and AIS spread prevention element of the AWI. The AWI works to improve the quality of ecosystems through environmental research and management of AIS infestations across the Adirondack Park. The AWI mission involves providing on-site stewardship of terrestrial and aquatic natural resources, primarily through public education, field monitoring, and service work. The AWI works closely with state environmental agencies and local advocacy groups, such as lake associations and regional environmental organizations, to protect the integrity of native ecosystems from the negative effects of AIS. Since 2000, when the AWI began posting stewards at Upper St. Regis Lake and on St. Regis Mountain, the program has gradually expanded through the central and western Adirondacks and now stretches into St. Lawrence County and along the shore of Lake Champlain. For 18 years, the program has built relationships with lake associations and the NYS DEC resource managers, Forest Rangers, Division of Operations, and Bureau of Fisheries as AIS prevention has emerged as a top priority among the scientific, property owner, and tourism communities of the region.

Upper St. Regis Lake	110	7 days/week

Steward Training

Boat launch stewards participated in a weeklong staff training program to familiarize them with inspection methods, data collection protocol, safety, AIS identification and ecology, AIS spread prevention steps, public education techniques, and the natural and cultural history of the Adirondack Park. For the eleventh year, the AWI hosted a state-wide steward training with the LCBP, our own stewards, ESF interns employed by the NYSDEC, and stewards sponsored by individual lake associations across NYS. Participants traveled to Paul Smith's College to experience this multiple-element training. Staffers from the Adirondack Park Invasive Plant Program (APIPP), AWI, LCBP, and SUNY Oneonta gave hands-on training sessions on AIS identification and ecology, public interaction and education skills, and data collection procedures. In addition, trainees benefited from presentations by the LCBP, the NYSDEC and the Adirondack Park Agency (APA).

The AWI stewards also participated in sexual harassment awareness training and Leave No Trace training delivered by the Adirondack Mountain Club. Staff training throughout the season on different topics is important to encourage ongoing education and positive morale. The Regional Supervisors began orientation

and training one week before the stewards to create schedules, organize outreach events and start other pre-season preparation work in their areas.

Watercraft Inspector Methods

Beginning on Memorial Day weekend, AWI had full coverage for the 12 weeks from May 27th to August 20th, and then partial coverage Friday – Sunday through October 9th as staff was available. AWI was able to maintain full coverage at selected locations. Every year, many seasonal staff members return to their university studies in the latter half of August, which requires our managers to adjust coverage. Stewards inspected watercraft and educated visitors at more than 60 locations including 43 different waterbodies. Stewards worked from 7:30 AM to 4:00 PM with one hour off for breaks and lunch. Shift timing was modified in some instances to fit local traffic conditions. This was the third season that the AWI provided additional coverage at selected locations through Columbus Day Weekend. Some boat launches were covered seven days per week while others were staffed part of the week, maximizing coverage during high-use periods (Table 2). Boat ramps were selected by AIS spread prevention risk assessment in conjunction with NYSDEC, APIPP and LCBP. Stewards were instructed to gather visible data on each visitor party, including group size, type of watercraft, state of boat registration, and time; greet each group whether launching or retrieving, offer a short educational message, share brochures and resources, and perform a careful boat inspection including removal of all visible transported materials (vegetation, mud, organisms, etc.) and draining all standing water. If a boat did not meet the clean, drained, dry standard, boat operators were referred to a nearby decontamination station for voluntary boat decontamination. Stewards shaped their approach according to the characteristics of the particular boat launch, their assessment of visitor background and receptivity, and environmental considerations.

Steward Carly Haralson removes aquatic plants from a boat.

Staff coverage at individual boat launches depended upon visitor use patterns and resource availability (Table 2). Stewards were present seven days per week at high-traffic launches such as Chateaugay Lake, Cranberry Lake, Fourth Lake, Lake Flower, Long Lake, Raquette Lake, Second Pond, Broadalbin and Northville on Great Sacandaga Lake, both launches on Lake Placid, and multiple launches on Lake Champlain. At a number of sites, such as Lake Abanakee, the Pine Cone Boat Launch on Cranberry Lake, various Indian River Lakes, Floodwood Pond, Hoel Pond, the Crusher Launch on the Raquette River, and the Wilson Hill launch on the St. Lawrence River, a steward was present on only a few days for educational purposes or event coverage. Decontamination stations (with high-pressure, hot water decontamination wash equipment) commenced service on different dates during the summer as site preparation activities, signage, and equipment became operational. The stations were open a minimum of five days per week after service began.

Each steward set up a workstation, depending on the site layout and amenities present at each location, which included an informational table, a chair, a sandwich board sign positioned to alert visitors to the steward's presence and a tent for protection from the elements and biting insects. Each table included brochures,

handouts, maps, plant samples, identification guides, and other resources to expand the boaters' knowledge of AIS and appropriate spread prevention measures. Stewards engaged visitors by displaying live aquatic plant samples and other props such as water chestnut nutlets, Asian clam shells, and preserved spiny waterflea samples at every table. The stewards enhanced their table displays during Invasive Species Awareness Week, the second week in July, by creating posters and other special exhibits. The stewards wore an AWI nametag and a dark blue polo shirt displaying the AWI logo. Depending on the weather, they also wore a black fleece with the AWI logo.

Pressure washing units were stored and locked in either metal storage containers or a wooden storage shed, depending on the location. These storage facilities also housed signs, personal protective equipment, cones and other gear such as lower unit flushers, buckets, and tarps. Personal protective equipment provided to the decontamination station operators included tinted safety glasses, face shields, gloves, ear protection, high visibility orange vests, and hard hats. ABC type fire extinguishers were provided at all decontamination sites. Signs and cones were set up and taken down each day at the beginning and end of shifts. NYS DOT signs could also be opened and closed in many locations to avoid confusion when stations were not in operation. Technicians would set up the pressure washing units at the beginning of their shift and run the unit to ensure that it was ready for use. Units were allowed time to cool before being placed into the storage containers and locked for the night. Cones and signs were set up in a way that allowed for inspections and decontaminations to take place at the same time if needed. Oil absorbent socks were placed along infiltration basins to wick up any oil that might be washed off during decontamination. An effort was made at all times to not obstruct the flow of traffic and to keep all involved at safe distance from moving vehicles.

Steward Dave Prosser greets a boater at Upper Saranac Lake.

Stewards provided boaters and visitors with interpretive information concerning AIS and conducted a short survey. The survey questions included what body of water boaters had most recently visited in the past two weeks with their watercraft and what steps were taken to prevent the transport of AIS between waterbodies. Boater responses were recorded on an iPad using proprietary survey software and uploaded wirelessly to a server for weekly download and analysis by the Data Manager.

All stewards provided a courtesy inspection of boats entering and leaving through the boat launch. Stewards performed a visual inspection of propellers, outdrives, trailer bunks, axles, live wells, bilges, areas containing standing water, and any other locations potentially harboring AIS. Stewards also asked visitors to lower their motors to a vertical position to eliminate standing water and drain their bilges into a bucket provided by the steward. Stewards offered informational literature on AIS and educated boaters how to prevent infecting other waterways. Although the stewards performed courtesy inspections for visitors, they also recommended that boaters take responsibility for washing and inspecting their boats offsite.

The inspection and decontamination process varied to some extent by the functional characteristics of each location. Decontamination stations were either located at high-risk boat launches or along busy roadways. Any boat that failed to meet New York State's Clean, Drained, Dry standard was requested to comply with a voluntary decontamination at the adjacent or regional decontamination station. In an attempt to keep the process

quick and give boaters a positive experience, only the part of the vessel that failed inspection was decontaminated. Stewards picked off visible plants, which could be completely removed by hand.

Stewards conducted decontaminations by moving from the inside to the outside of each vessel. Internal compartments found with standing water were flushed with low-pressure hot water (140 degrees F). This includes bilges, ballasts, and live-wells as well as any other area where standing water may have accumulated. If rigging, fishing lines or other gear was found to need decontamination, the items were removed from the vessel if possible, and placed on the ground for high-pressure hot water decontamination. If equipment was considered too delicate for high pressure, then low-pressure hot water was used.

Outboards and lower units found with standing water in them underwent a flushing process, which consisted of low pressure hot water introduced to the lower unit via flushing muffs, the boater starting the motor, and running the motor until the cooling water discharge was 140 degrees F. Temperature could be adjusted on the LANDA units and was measured with a laser thermometer or by observation of sufficient steam water vapor. Lastly, hulls that required decontamination were carefully washed with high pressure hot water. Technicians directed wash water to remove surface organisms by holding the wash wand at a 45-degree angle to the hull of the boat and slowly sweeping in one direction. Technicians used various decontamination methods to most effectively clean various features on watercraft, such as pontoons, outdrives, and other equipment.

Program Administrative Structure and Procedural Overview

The program was managed by a Director, Assistant Director, Decontamination Services Program Manager, two Program Managers, Data Manager and Program Administrator in 2017. The Decontamination Services Program Manager's duties primarily included oversight of the decontamination station logistics, including choosing and preparing a site, setting up and tearing down the stations, and maintaining the stations during the summer. The Program Managers directly oversaw the Regional Supervisors responsible for managing stewards in the nine regions designated throughout the program. The Data Manager downloaded the AWI data weekly and followed up on errors that she found. She also worked with the regional supervisors for additional quality control and maintained the data for outside organizations that used the AWI software. The Program Administrator approved all employee timesheets twice monthly and submitted check request forms, reimbursement forms, and purchase order request forms to the financial office at PSC.

Supervisor Jerry Egenhofer with his staff during steward training.

The stewards were divided into nine regions of approximately 10-14 stewards apiece. The regions were named by cardinal directions or local designations: Central, Champlain North, Champlain South, Cranberry-Long, Fulton Chain, Schroon, South, Paul Smiths, and Tri-Lakes. A staff meeting was held on Mondays at the AWI building at PSC which was attended by the seven Regional Supervisors, either in person or via phone. Weekly staff meetings were held on Thursday or Friday in each region and run by the appropriate Regional Supervisor, which gave the stewards a chance to share information with each other as well as their supervisor. Most stewards lived within driving distance of one of the meeting locations, although a few stewards attended meetings less frequently due to extreme distance or part-time work status. The meetings also provided continued staff training and afforded an opportunity for identification of AIS found during the previous week.

The stewards first attempted to identify the AIS samples they collected. Unclear or hard-to-identify samples were transported to PSC for a second review and further identification from the scientific staff at the AWI. The Regional Supervisors reviewed the survey data for omissions, errors, or irregularities and followed up with the stewards for clarification. One region, Schroon, was comprised mainly of stewards employed by local towns and lake associations. This Regional Supervisor managed all the employees and data and would report to the local designated employers if any problems arose. He did not have weekly staff meetings, but did have a few meetings over the summer to coordinate the various stakeholders.

AWI administrators oriented stewards to each boat launch workstation during staff training, often with the assistance of lake association members. The Regional Supervisors conducted unannounced site visits during the week to observe and support each steward individually. Six of the nine AWI regions had a steward designated as Weekend Supervisor for their respective areas. Weekend Supervisors conducted site visits to support and monitor each Steward and participated in outreach activities when the Regional Supervisor was not on duty.

The Stewardship Program grew slightly larger compared with 2016, due to the continuation of the Adirondack AIS Spread Prevention Program by New York State's Department of Environmental Conservation. There were continuing challenges associated with the late spring initiation of the contract extension. Sixteen decontamination stations were prepped, equipped and staffed at various dates over the summer, depending on logistics, agency approval, and capacity of the NYSDOT and local Highway Departments. The AWI had its seventh season of GLRI funding. The Director focused on grant administration and agency communication and coordination, and the Assistant Director oversaw the Program Managers and Regional Supervisors in the different geographical corners of the park. The Regional Supervisors created and maintained work schedules, ran weekly staff meetings, and conducted most of the site visits for the stewards in their region.

Steward Special Projects

Some stewards spent one day per week working on a special project other than AIS prevention at the boat launches. These projects served as an additional avenue to disseminate the AWI message and to coordinate with partner organizations. Stewards monitored loons on Big Moose Lake, Upper and Lower St. Regis Lakes and Spitfire Lake for the Biodiversity Research Institute and worked with APIPP to manage purple loosestrife through hand pulling in several locations. Stewards also assisted PSC professors with research projects on Lyme disease and bird-window collisions.

Supervisor Janelle Hoh doing educational outreach at Lake Placid.

Networking, Meetings and Outreach Activities

The Director attended regular meetings of APIPP, the Adirondack AIS Committee, NYSDEC collaborators, and the LCBP and made several conference and meeting presentations including the Adirondack Lakes Alliance annual symposium and the International Conference for Aquatic Invasive Species in Florida.

The Director also made several progress presentations to the Adirondack Park Agency, the Fund for Lake George, NYSDEC, APIPP and the LGPC.

The AWI attended Environmental Protection Fund Lobby Day in the NYS Legislative Office Building in Albany in February. The AWI Program Manager conducted a Volunteer Lake Steward Training at the Horicon Town Hall for members of the ESSLA (East Shore Schroon Lake Association), Schroon Lake Association, Brant Lake Association, Paradox Lake Association and Loon Lake. This training allowed AWI to provide consistent information to other areas of the Park. PSC hosted the third Adirondack Lakes Alliance Symposium in August. The AWI partnered with the APIPP, Raquette Lake Preservative Foundation, and Blue Mountain Lake Association during the Adirondack Canoe Classic to prevent the spread of AIS along the 90-mile race route, from Old Forge to Saranac Lake. AWI staff also assisted in the safety, organization, and logistics of the St. Regis Canoe Classic race.

Stewards assisted with AIS inspections, buoy marking and race monitoring at the St. Regis Canoe Classic.

The AWI coordinated data collection from steward programs run by various Adirondack lake associations. AWI provided iPads to the ESSLA, Schroon Lake Association, Brant Lake Association, Paradox Lake Association, and Loon Lake Association for the duration of the season. Lake associations were encouraged to purchase any additional iPads they needed with the AWI providing the data collection software. Each association had unique survey and login credentials. This arrangement allowed the AWI to collect lake association data directly for use in park-wide AIS spread vector analysis. In the future, the AWI will offer this service to more lake associations. Managing several lake associations' survey training, data collection practices, and devices requires a dedicated staff member. Lake association steward employees are often volunteers or late-career adults and sometimes need different training and support compared with the typical AWI employee.

Recommendations and Conclusion

The hiring, training and administration of 119 seasonal employees requires increased off-season staff capacity. For 2018, AWI will improve both supervisor and steward training using detailed employee feedback collected during the 2017 season. Additional off-season staff will also allow the AWI to expand outreach and education programming to various user groups in Adirondack communities. The AWI plans to increase the

number of staff appearances and participation at relevant meetings and events across the Adirondacks and surrounding area during the off-season. During the field season, the weekly staff meetings of regional employees need increased standardization and coordination to facilitate information exchange across the entire program and through all levels of the organization.

The AWI Stewardship Program completed its eighteenth successful season. As always, the professionalism, enthusiasm, and dedication of the stewards provides the backbone of the program. The stewards need to be extremely outgoing and friendly towards the public, mature and responsible enough to handle independent work, and creative enough to avoid boredom with the position. The AWI continues to be involved in outreach beyond boat launch inspections to present the message to all boaters.

Acknowledgements

The AWI would like to acknowledge the funding support of the New York State Environmental Protection Fund, United States Environmental Protection Agency Great Lakes Restoration Initiative, the Lake Champlain Basin Program, the St. Regis Foundation, the Rainbow Lake Association, Black Lake Association, the Upper Saranac Lake Foundation, the Lake Placid Shore Owners' Association, the Great Sacandaga Lake Association, the Great Sacandaga Lake Advisory Council, Towns of Arietta, Lake Pleasant, Long Lake, and North Elba, and Paul Smith's College. In addition to financial support, the invaluable enthusiasm and contributions of people at each of these agencies and associations has injected creativity, enthusiasm and vision into what we do.

We gratefully rely on the collaboration of our close working group of Brendan Quirion, Erin Vennie-Vollrath, and Zack Simek of APIPP, Meg Modley of LCBP, Dave Wick, Justin Luyk and Joe Thouin of LGPC, and Jane Smith and Ed Griesmer of the ALA. We would also like to thank the NYS DEC Invasive Species Coordination Unit: Dave Adams and Catherine McGlynn. Also, NYS DEC Natural Resources Assistant Commissioner, Kathy Moser, and Region 5 and 6 Regional Directors Robert Stegemann and Judy Drabicki, and Region 5 operations head Nik McKay were all supportive. We had tremendous collaboration with NYSDOT as well, particularly John Hallock. Bill Farber, Hamilton County Board of Supervisors, Fred Monroe, Adirondack Park Local Government Review Board, Eric Siy, The FUND for Lake George, and Sherman Craig, Cranberry Lake resident and Adirondack Park Agency Chair were invaluable as well. In addition, we wish to thank the following supervisors for their collaboration: Rick Wilt, Town of Arietta, Dan Wilt, Town of Lake Pleasant, Brian Wells, Town of Indian Lake, Matt Simpson, Town of Horicon, John Frey, Town of Inlet, and Clark Seaman, Town of Long Lake. Finally, we would like to thank all other partners, too numerous to mention, that were involved in expanding and developing our program throughout 2017.

Summary of Results

Eric Holmlund, Director, with Sue O'Reilly, Data Manager,
Adirondack Watershed Institute Stewardship Program

The AWI runs the most widely deployed, most extensive and visible AIS education and spread prevention program in the Adirondack region, as well as in New York State. The 2017 boating season featured the continuation of the Adirondack AIS Prevention Program and Lake Ontario Headwaters Watercraft Inspection Program funded primarily by New York State and the federal Great Lakes Restoration Initiative. It also included many continuing partnerships with municipalities and lake- and shore-owner associations.

Considered as a whole, the AWI conducted the most encompassing and integrated AIS spread prevention program in the history of the Adirondack Park. The AWI Stewardship Program initiated service in 2000 with 8 employees covering 1 boat launch, and grew over the years to 119 staff servicing 43 different lakes plus 16 decontamination stations in 2017 (Figure 2).

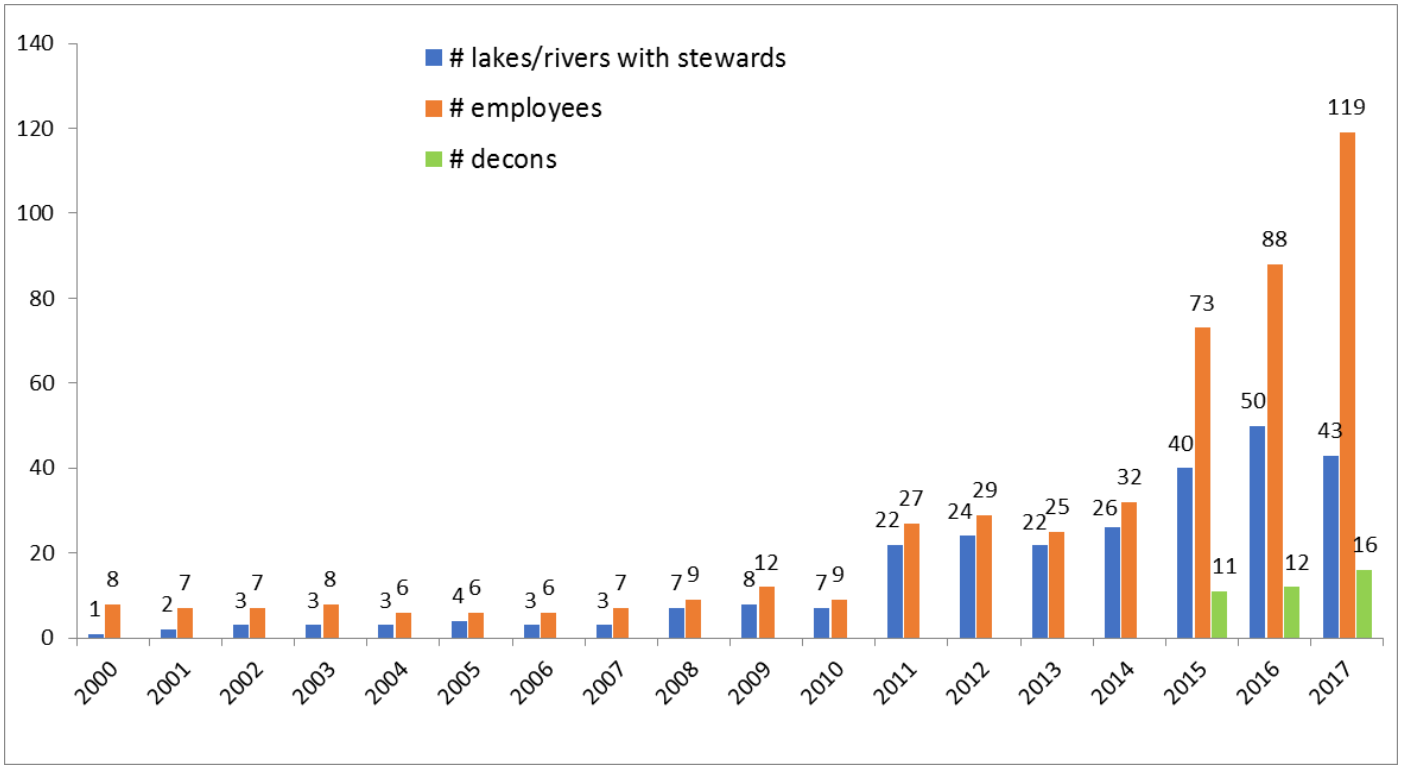

Figure 4. Number of lakes with AWI steward coverage, number of stewards, and number of decontamination stations, 2000-2017.

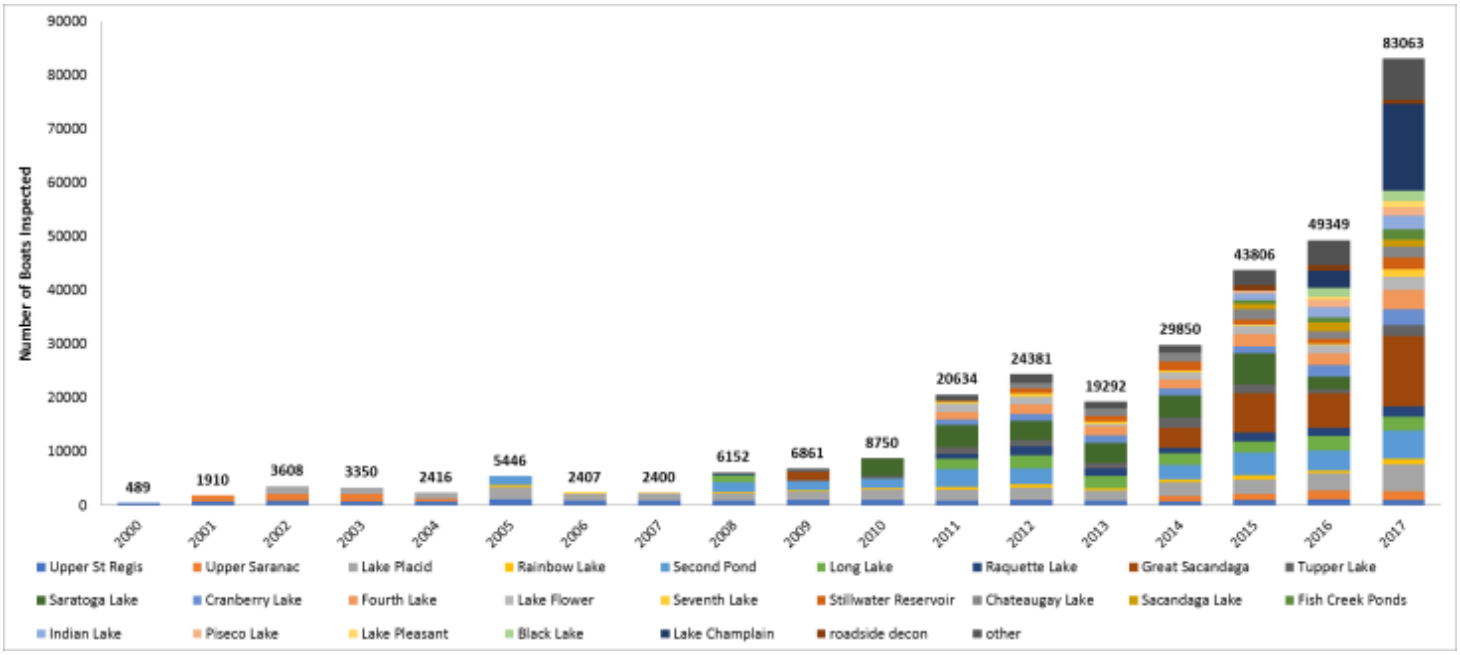

Figure 5. Number of watercraft inspected by AWI stewards 2000-2017.

Comprehensive Findings

The 2017 field season ran from Memorial Day weekend through Labor Day weekend (May 27 – Sept 4, 2017) with extended coverage at many locations through Columbus Day (Oct 9) pending staff availability. Many decontamination stations and steward locations were kept open through Columbus Day to service boaters in the fall shoulder season. In total, 119 AWI stewards performed 83,063 inspections and contacted 170,689 people with the program's message about AIS spread prevention, boat and equipment hygiene, and the ecological losses caused by the establishment of AIS (Table 3). Adding our partner programs' (Brant Lake, Canada Lake, Caroga Lake, Loon Lake, Schroon Lake) inspection figures, totals rise to 97,412 watercraft and 202,766 people. The number of boats inspected at each individual water body varied substantially, ranging from Lake of the Woods, with 8 boats inspected, to Lake Champlain, where coverage at 9 launches inspected a total of 16,067 watercrafts. Numbers of visitors at each site varied with factors such as weather, site popularity, days of steward coverage and ease of accessibility.

Differences in the totals of people and vessels encountered on each lake arise from differences in each lake's morphology, site layout, ramp size and condition, available parking, location and accessibility. Stewards at lakes with hard-surfaced boat ramps are much more likely to encounter a greater proportion of motorboats whereas car top launch sites are dominated by paddle-powered craft such as canoes, kayaks and stand up paddleboards (SUP's). Motorboats represented the majority of boats inspected this summer at 66%. Kayaks (18%), canoes (7%) and personal watercraft (7%) represented smaller but substantial percentages of use. Sailboats, rowboats, barges, SUPs and docks rounded out the remainder with percentages at 1% or less (Table 4). The lake with the greatest proportion of motorboats was Lake Champlain with 14,280 motorboats, representing 89% of its total use. Second Pond remains the top location for non-motorized craft (canoes, kayaks, SUP's, rowboats) with a total of 3,323 or 62% of watercraft encountered falling into these categories.

The following infrequently visited locations are not included in the individual location use summaries at the end of this report but are included in the following comprehensive data summary tables: Floodwood Pond, Higley Falls Reservoir, Hoel Pond, Lake Abanakee, Little Clear Pond, and Raquette River (Crusher Launch).

Stewards detected and removed organisms at different frequencies depending on location (Table 3). While the average frequency for visible organism transport was nearly 11%, the visible organism transport figures ranged from 2% or less at multiple locations to much higher values at locations such as Chazy Lake (56%), the St. Lawrence River (44%) and Chateaugay Lake (31%). Other locations with noticeably higher than average organism transport rates were Osgood Pond (31%), Black Lake (26%), Sacandaga Lake (24%), Butterfield Lake (22%), and Fish Creek Ponds (22%). Visible organism transport rates include watercraft transporting native vegetation. Additional site variability was caused by each boat ramp's proximity to weed beds, differences in traffic volume, wind and wave action, employee diligence, or the layout and physical characteristics of the different boat ramps. It is also worth noting that as the season progressed, more boats were found to be transporting visible organisms as they departed waterways than upon launching, with 10,544 organisms detected on vessels retrieving and 4,719 on vessels launching (Table 3).

In 2017, AWI and partner stewards detected 15,394 organisms on 10,636 vessels as the result of 97,412 inspections (Table 3). Of the organisms observed, 3,849 were confirmed AIS including: EWM (2,289), curly leaf pondweed (684), zebra mussels (359), variable leaf milfoil (339), water chestnut (157), spiny waterflea (12), brittle naiad (5), Asian clam (1), European frogbit (1), hydrilla (1), and quagga mussel (1) (Table 5). All suspect AIS samples were bagged, labeled and delivered to AWI's Spaulding-Paolozzi Environmental Center Laboratory at PSC for further scrutiny and confirmation of positive identification by an AWI Research Associate.

Lake Champlain had the greatest number of AIS detected with 2,655 or 13% of boats inspected transporting visible AIS (Table 5). The highest numbers were found at the launches located at Ticonderoga (783), Westport (449), and South Bay (433). This result is likely attributed to the fact that Lake Champlain has some of the busiest boating traffic in the region and contains several well-established AIS.

Table 6. Organism transport rates and AIS spread prevention steps by type of watercraft, 2017.

Type of Watercraft	# boats transporting any organism	% of 3,781 boats transporting any organism	Total # boats inspected	% of all boats transporting any organism	% of groups showing AIS spread prevention awareness

Grand Total	**10636**		**97412**	**10.9%**	**72%**

Each type of watercraft transported organisms and AIS at differing rates (Table 6). Non- motorized watercraft (sailboat, canoe, kayak, rowboat, and SUP) were less likely to transport anything (including grass, pine needles, and other organic material), and again were less likely to transport AIS than motorboats. Of the 10,636 vessels transporting any organism, 7,779 or 73% were motorboats. Kayaks transported 1,556 organisms or 14.6% and canoes were responsible for 629 transport instances or 5.9% of the total transport figure. To put

these figures into perspective, 8% of all motorboats inspected were transporting visible organisms, 1.6% of kayaks and 0.6% of canoes were found to be transporting a visible organism of any kind.

During the 2017 stewarding season AIS were observed on all types of watercraft except for stand-up paddleboards. Barges showed the highest percentage of AIS transport at 20%, although only 20 barges were inspected so the number should be read in context. Of the 64,275 motorboats inspected, 3,012 or about 4.7% were transporting AIS. Sailboats had the next highest percentage at 2.4% and personal watercraft at 1.8%. Consistent with past years, 2017 data suggests that motorboats are far more likely to be transporting AIS than canoes, kayaks or other non-motorized vessels (Table 7).

When asked by stewards, an average of 72% of boaters showed AIS spread prevention awareness (Table 8). Boaters were asked if they had taken AIS spread prevention steps prior to arriving at the launch or decontamination station. If a boater said yes and was able to describe the steps without prompting from the steward, this counted as an affirmative response for the "Yes" metric (Table 8). If a boater said, "No, because my boat only goes in this lake," it was also counted as affirmative because the boater was demonstrating the knowledge that their boat was not an AIS transport risk. First launch of the season and frozen boats were included in the affirmative metric for the same reason. While administering the recreational use survey, stewards were trained not to lead the interviewee to a particular answer. For example, when asking if a visitor had taken any steps to prevent the spread of AIS, the steward would not provide examples of such actions, as the visitor might simply default to the offered choices for the sake of providing an answer.

Of the groups surveyed, 23% reported having inspected their vessel for visible AIS, 22% reported that they had washed it, 15% drained the bilge and 10% let their boat dry prior to launching it. Other spread prevention measures such as draining live-wells and disposing of unused bait properly were reported less frequently. Single-lake boats (22%) and first launch/frozen boats (12%) also comprised significant percentages (Table 8). It is important to note that the percentage of boaters who responded, "Yes" to the spread prevention awareness question varied greatly from lake to lake. Some locations with comparatively few days of coverage yielded results ranging from 100% to 0% of visitor groups showing spread prevention awareness. Several locations with comparatively large sample sizes reported visitor AIS spread prevention behavior well above our 2017 average: Canada Lake (92%), Great Sacandaga Lake (87%), and Chateaugay Lake (86%).

Previously Visited Waterways

Stewards stationed at the launches and decontamination sites asked boaters to identify the last waterway visited by the watercraft within the previous two weeks. The number and diversity of previously visited waterways varied significantly between steward locations. Findings for each individual lake can be found in the Location Use Data Summaries section at the end of this report.

Overall, about 43% of boaters reported that their vessel had last been used in the lake that they were currently launching into or retrieving from. This result follows the trend from the previous two years in which the answer "same lake" ranked as the number 1 answer and the response "none" remained second with 33% of the responses (Table 9).

Combining responses of "same lake" with "none" indicates that 76% of visitors to the lakes in the AWI network did not present a high level of risk of transporting new AIS to individual waterways because either their boat had been out of water for at least two weeks (presumably drying the watercraft and killing any aquatic hitchhikers) or they had simply taken out from a lake only to launch again in that same lake at a later point in time (Table 9).

Steward Steve Crain educating boaters on vessel inspection at Lake Champlain's Peru launch.

Table 8. AIS spread prevention information, 2017. Yes = showed AIS spread prevention awareness; I = inspected boat; WB = washed boat; DB = drained bilge; BB = emptied bait bucket; LW = drained livewell; Dis = disposed of unused bait; Dry = dried boat; Same Lake = boat only goes in this lake; First/Frozen = first launch of the season or frozen boat.

Plant identification at steward training.

Decontamination Station Results

The New York State DEC issued a one-year contract for the AWI to continue the Adirondack AIS Prevention Program through the 2017 boating season. Performance analysis of outcomes at boat launches, high traffic intersections and gateway locations indicated many of the same asset locations as 2016 along with an increased focus on Lake Champlain.

Five decontamination stations were sited at existing high traffic NYSDEC public boat launches (designated B in Figure 4 below) on Lake Champlain: Peru, Port Henry, South Bay, Ticonderoga, and Willsboro. Additional stations were located at the Broadalbin and Northville launches on Great Sacandaga Lake, the Hudson River launch at Luzerne, and the launches on Lake Placid, Second Pond, and Upper Saranac Lake. Partner-operated stations were also located at Loon Lake and at the Horicon launch on Schroon Lake. Three locations, Colton, Old Forge, and Star Lake, were located at so-called gateway locations (G), along highways on the park periphery, as well as partner locations at Caroga and Northern Schroon/Paradox. These sites were intended to intercept trailered watercraft arriving and leaving the Adirondack Park. Two locations were designated at interior roadside (I) locations: Piseco Lake (Route 8) and Speculator (Route 30). Due to limitations in staff and contractor availability, logistic constraints, and workload, the decontamination stations came online at various dates ranging from 5/27/17 (Speculator) to 8/21/17 (Colton). Together, the AWI-managed decontamination station stewards performed 19,510 inspections, resulting in 2,262 inspections detecting organisms and the removal of 1,258 confirmed aquatic invasive species. 11.6% of watercraft were found to be "dirty" or carrying some visible material, and 4.9% were found to be carrying a fragment of AIS. Stewards performed 1,962 voluntary decontaminations of dirty watercraft. The stations experienced great variability in traffic levels and compliance.

When the three partner-operated decontamination stations at Horicon, Loon Lake, and Caroga Lake are added to the AWI figures, the number of inspections totals 26,623, with 2,792 decontaminations performed, which removed 1,304 AIS. Just under 10% of boats were found to be dirty (carrying organisms or water), while 3.8% of inspected watercraft carried confirmed samples of AIS. The 20 decontamination stations were open a total of 1,551 days for an average of 1.8 decontaminations per day open.

The decontamination station at Horicon, operated by one of the program's municipal partners, tallied 6,115 inspections and 568 decontaminations. Lake Placid was the busiest AWI-managed site, with 3,954 inspections credited to the decontamination station. Stewards at the onsite NYSDEC boat launch at Lake Placid inspected the vast majority of watercraft and referred visitors failing to comply with the AIS transport law to the decontamination station, which was approximately 60 yards away but still accessible to the launch. A significant number of boat operators voluntarily visited decontamination, resulting in 158 decontaminations performed on watercraft despite just 77 inspections detecting organisms. Conversely, at the Ticonderoga decontamination site, 385 inspections yielded organisms but technicians decontaminated only 69 vessels due to lower boater participation in the full decontamination process. Hand removal of plants was more common at sites such as Ticonderoga. Technician approach, engagement methods when recommending decontamination to boaters, site layout, and boater receptivity has proven crucial to raising boat compliance with state regulation.

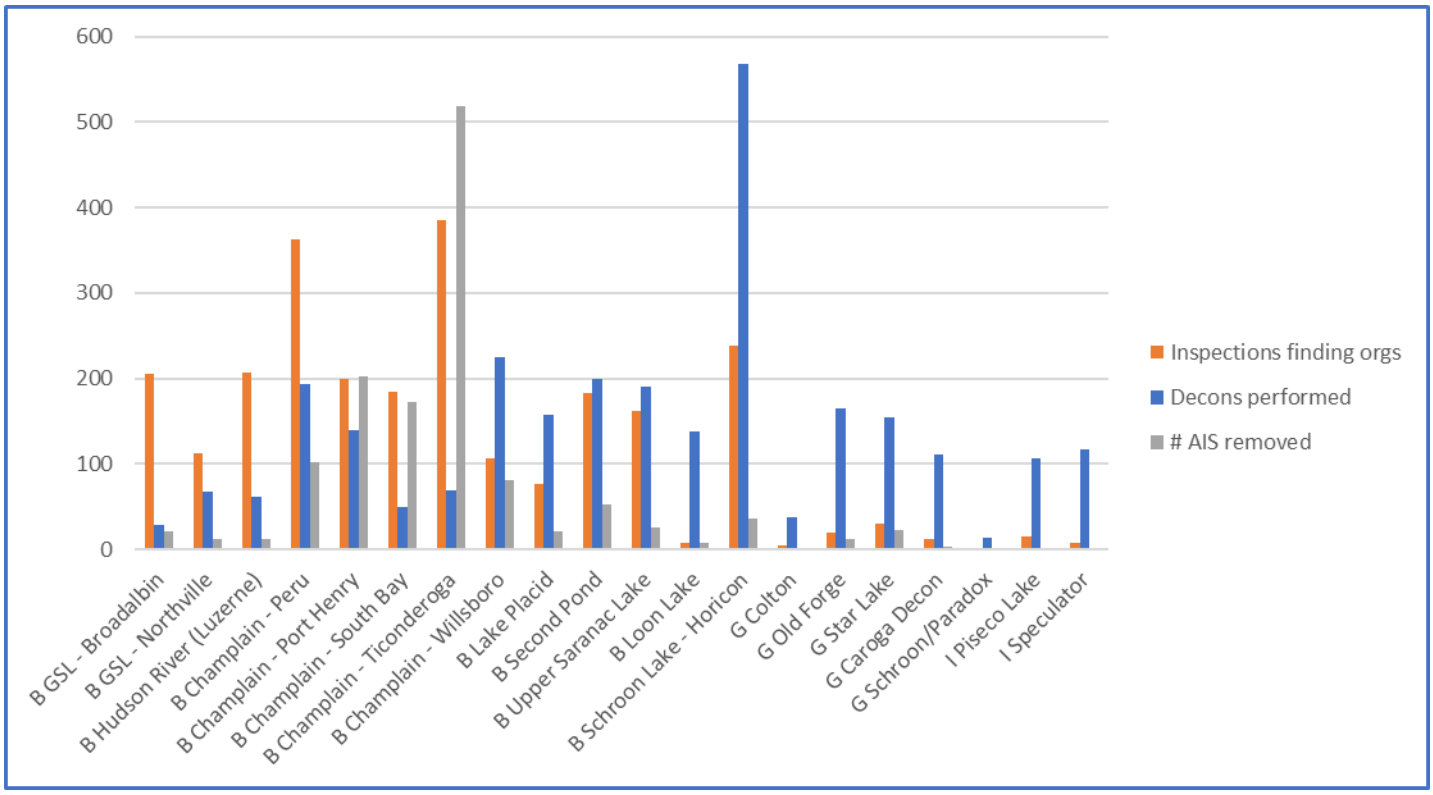

Figure 6. Inspections, decontaminations and AIS removed at decontamination stations, 2017. B = located at boat launch; G = gateway roadside location along perimeter of park; I = interior park roadside location.

Decontamination station stewards noted Eurasian watermilfoil (*M. Spicatum*) as the most frequently removed aquatic invasive species, with comparatively high counts of the organism removed from watercraft using boat launches servicing lakes with known infestations of the plant. More than five times the numbers of AIS were removed from watercraft departing inspection stations located at boat launches compared with those launching, which supports the premise that boats *leaving* infested waterways present greater comparative risk for transporting AIS (Table 11).

Table 11. AIS removed from AWI decontamination stations, 2017. BN = brittle naiad, CLP = curly-leaf pondweed; HYD = hydrilla; EWM = Eurasian water milfoil; VLM = variable leaf milfoil; SWF = spiny waterflea; WC = water chestnut; ZM = zebra mussel; AIS = aquatic invasive species.

Overall, decontamination stations located at boat launches (B) received the most traffic, performed the most decontaminations, and removed the most AIS. We do not conclude, however, that the gateway (G) or interior (I) decontamination stations are not important, or even essential, to the regional spread prevention response. G and I stations are much more visible than those tucked away at boat launches and so serve a vital public education purpose. 2017 results indicate roadside sites acting as resources for stewards to refer boaters to while in transit. The roadside location at Piseco Common School decontaminated 107 vessels out of 126 inspections and while only 15 inspections yielded visible organisms (Table 10), the decontamination procedure presumably removed small-bodied AIS, which have become established in several lakes in the Piseco-Speculator corridor. Designating expedited "fast lanes" at popular boat launches for sealed watercraft which have already passed an inspection should be a way to drive up traffic at roadside decontamination stations and provide increased performance for the system as a whole.

Inspection of the motor's lower unit is critical to detect hitchhiking organisms.

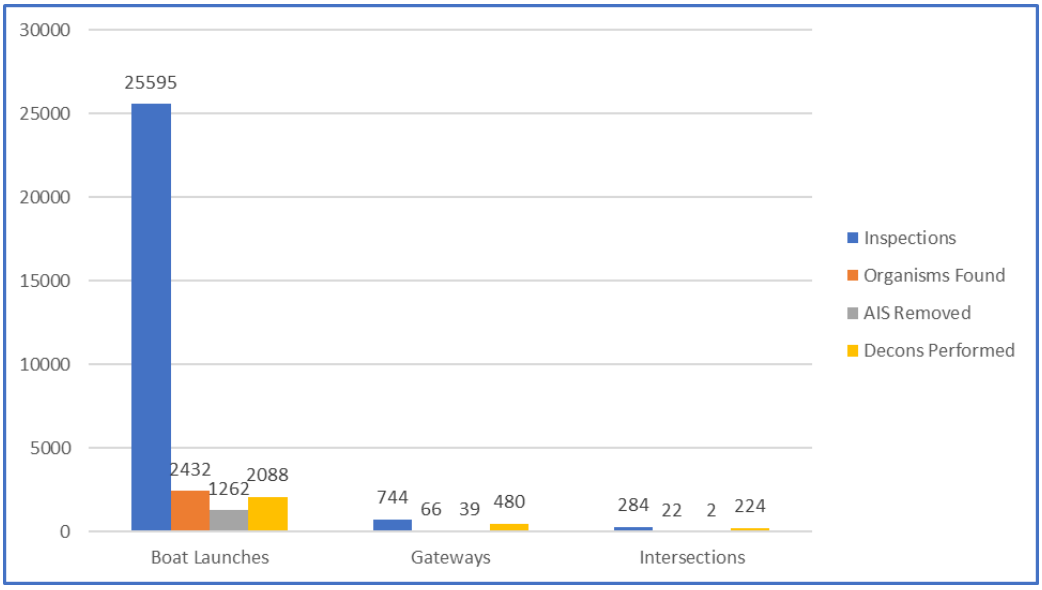

Figure 7. AWI decontamination station results by category, 2017.

2017 to 2016 Comparison

The Adirondack Park AIS Prevention Program results vary from 2016 in some important ways. The program increased performance in a variety of measures compared with 2016. In 2017, the program expanded 5% in number of locations served (four new sites), 33% in number of decontamination stations (increase from 15 to 20 locations), hired 22% more staff, saw 14% more watercraft, removed 121% more AIS, and performed 162% more decontaminations than in 2016 (Figure 9). AIS removal was up over 120%, including very large increases in water chestnut and milfoil. The increase in spiny waterflea is from 2 instances in 2016 to 12 in 2017, leading to the 500% increase. AIS detected on retrieving boats increased almost 150%, confirming the need to pay maximum attention to exiting watercraft (Figure 8).

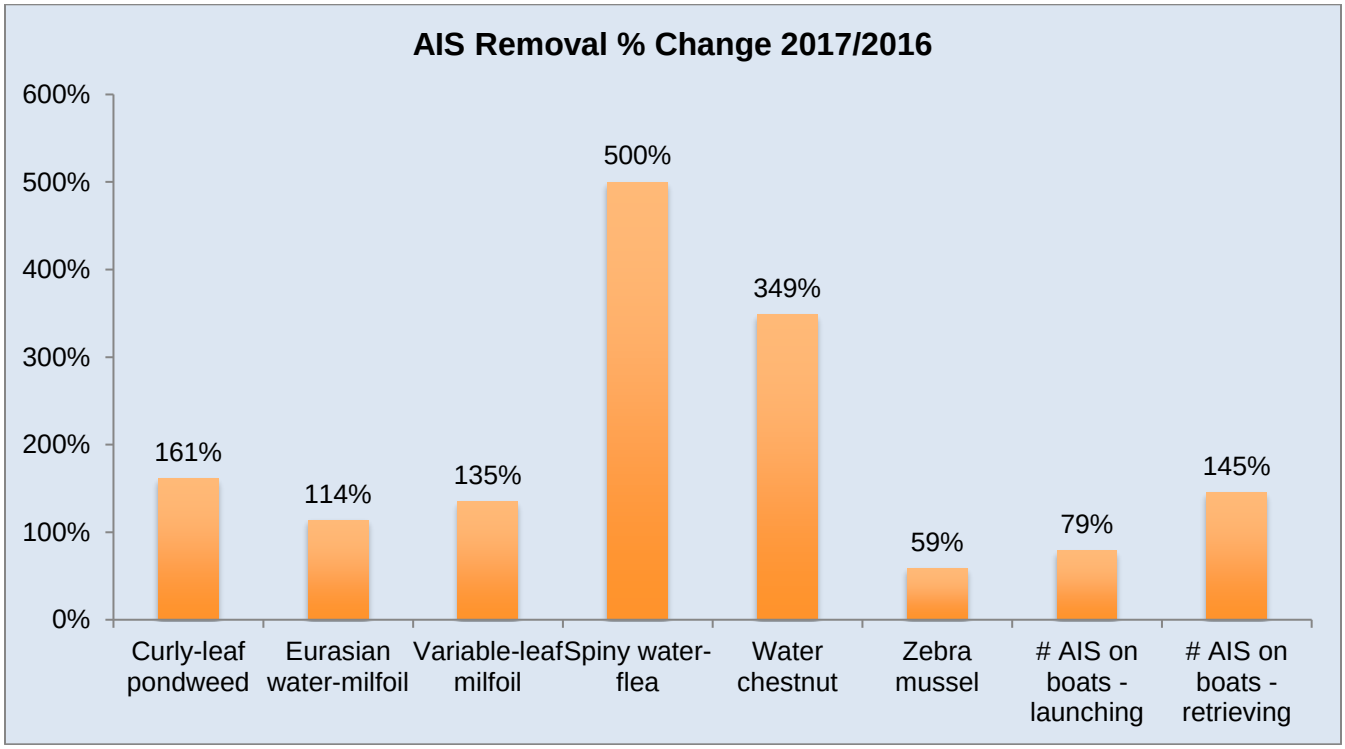

Figure 8: AIS removal comparison, AWI decontamination stations, 2017 to 2016

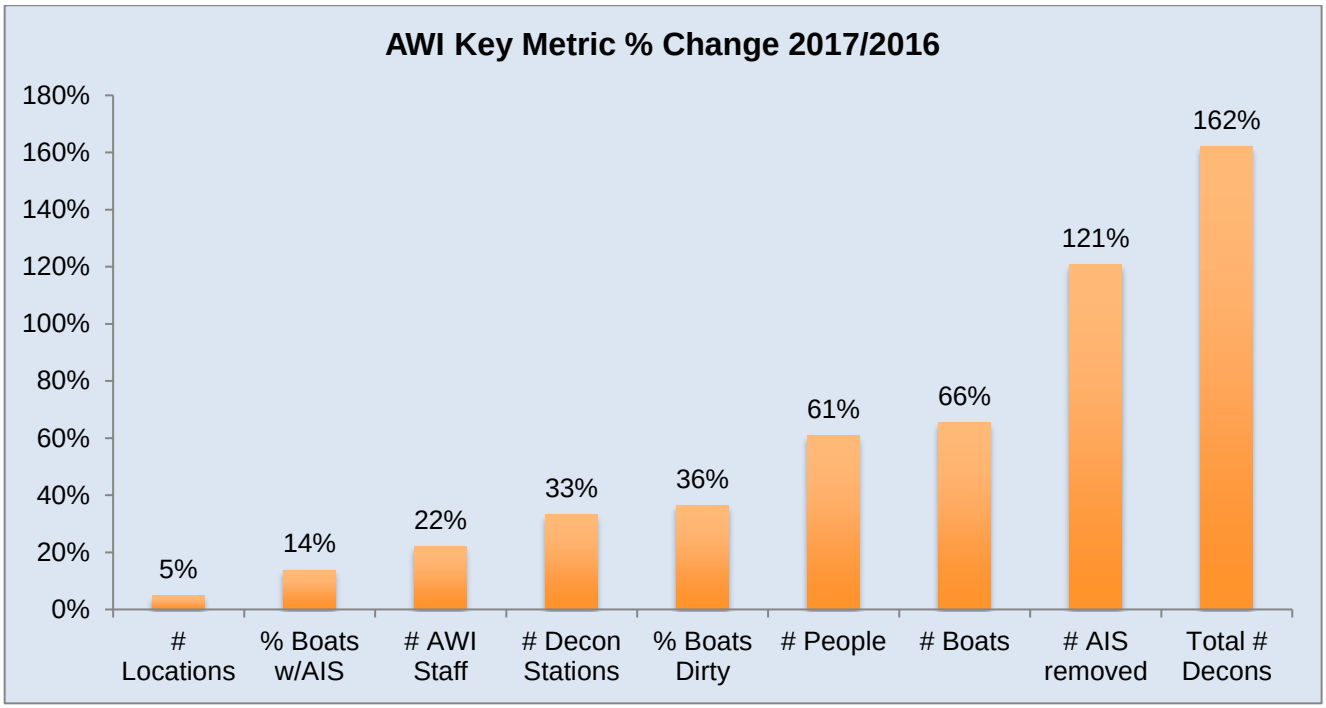

Figure 9: Key metric comparison, AWI decontamination stations, 2017 to 2016

If we consider the results of the decontamination stations from 2017 compared with 2016, we see a significant increase in several measures of productivity. Of fifteen active stations in 2016, eleven were also in service in 2017, providing an opportunity for performance comparison (Figure 10). Decontamination activity was up dramatically at every station excepting Ticonderoga (Lake Champlain), which saw a decline from its high level of activity in 2016 despite a large increase in the number of days open. Ticonderoga staff were less successful at convincing visitors to use the on-site decontamination station than they were in 2016, caused by less persistence and persuasiveness on the part of local staff. At other sites repeated from 2016, decontamination technicians were much more effective in flagging and decontaminating watercraft, with rates of increase in numbers of decontaminations between 27% and 283%. This overall strong improvement derives in part from increased numbers of days in service as well as improved familiarity and comfort by repeat technicians, and increased interest and compliance from watercraft operators. Each year, the challenge of making the public aware of the AIS spread issue and increasing compliance becomes easier due to the cumulative impact of the increasing number of inspection stations across the Adirondack PRISM. However, the program's disappointing results at Ticonderoga are a cause for concern and greater support and effective supervision by administrative staff.

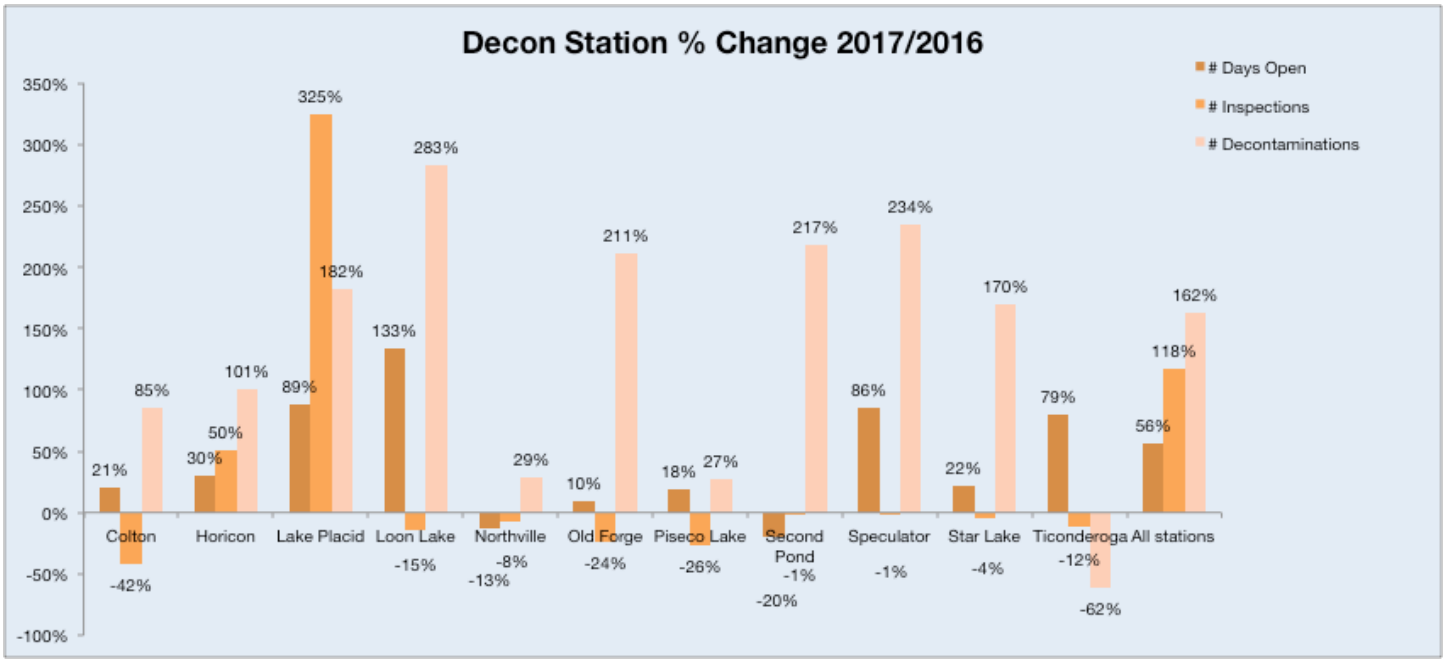

Figure 10: Year over year performance comparison, AWI decontamination stations, 2017 to 2016

Watershed Steward Network Analysis

The AWI examined various dimensions of boat ramp activity and findings to better understand how the boat launches function as a landscape-scaled system. By analyzing visitor responses to the question about where their boat has been last within the preceding two weeks, we were able to tally the number of confirmed outbound trips between lakes in the network of waterways with stewards by considering the previous visits (inbound) as confirmed *outbound* visits from the originating lake. For example, a visitor to Lake Placid states to the watershed steward that their boat was last used in Saratoga Lake, which represents a confirmed outbound trip from Saratoga Lake to Lake Placid. By plotting the three most frequently occurring outbound trip connections to lakes within our steward network, we begin to understand the pattern of most frequent interconnections among the lakes. Such information is helpful in determining, in consultation with the NYSDEC and APIPP, the optimal placement of stewards. We included data from cooperating steward programs to create a model of regional boat launch visit interconnection with implications for AIS spread (DeBolt, Holmlund, Johnstone, Rohne, & Smith, 2014).

An analysis of outbound boat traffic both within the Adirondack system of waterways and with significant signals from outside the region yields a complex representation of the potential AIS transport connections created between the waterways by operators of recreational watercraft (Figure 11). Many visitors visit several nearby lakes over the course of the summer. When considered at the landscape level, we can see how AIS in one lake could be transported via recreational watercraft to other lakes over the subsequent two weeks.

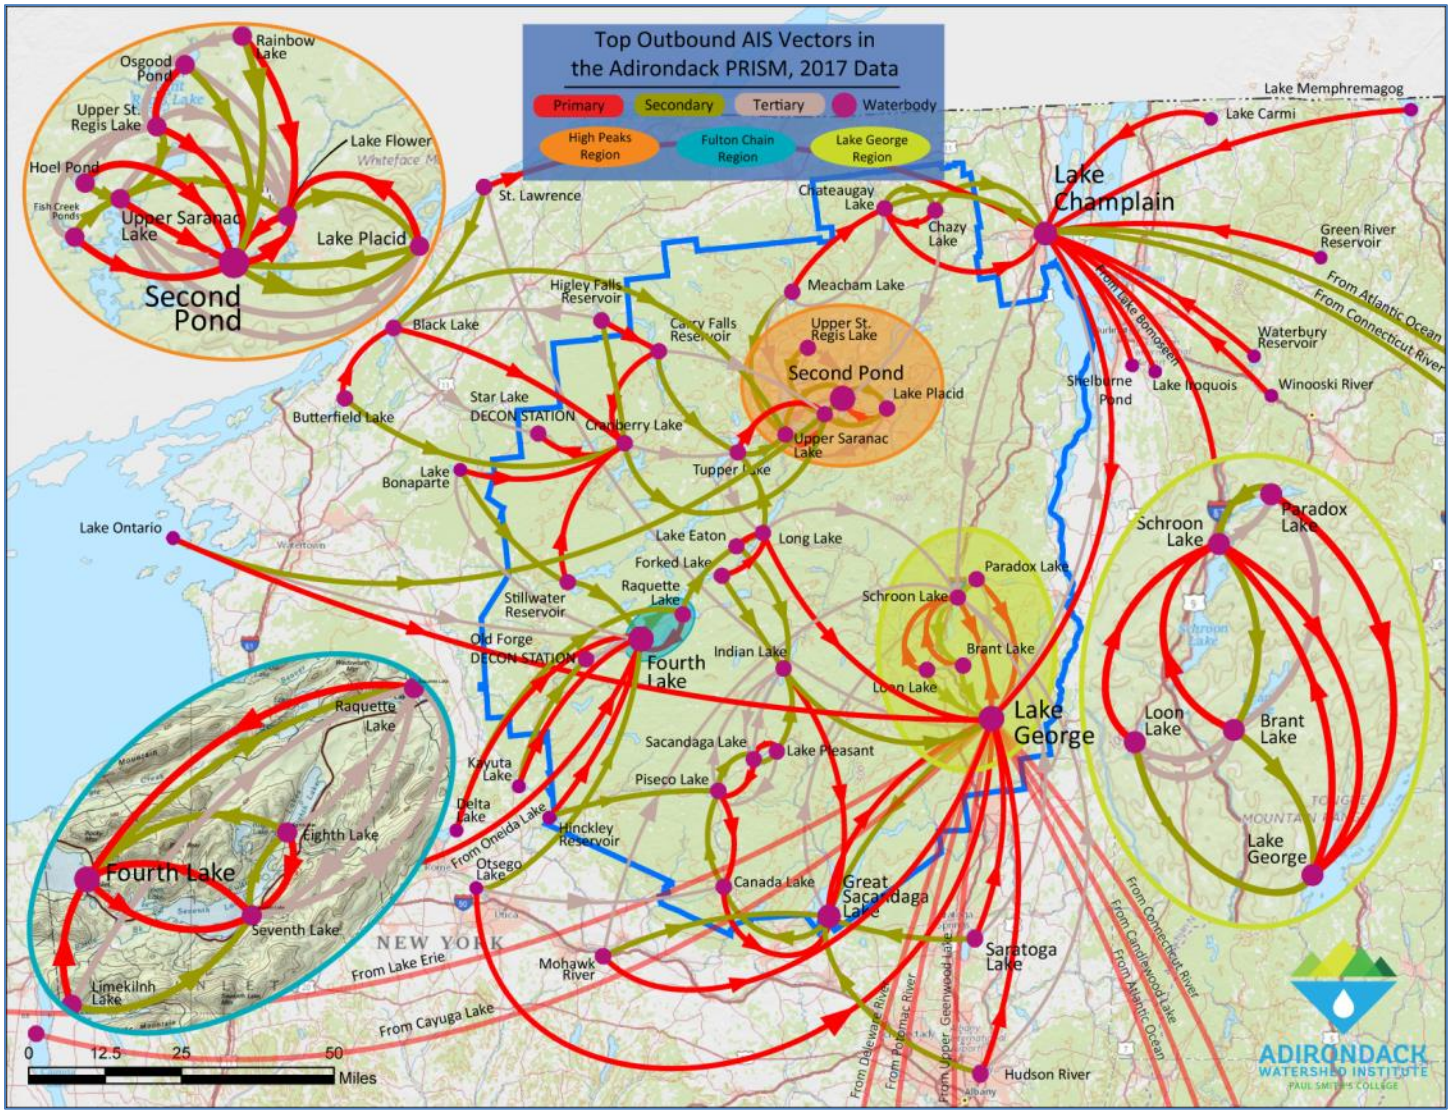

Figure 11. Top 3 Outbound AIS Pathways in the Adirondack PRISM, 2017. Includes data from the Brant Lake Association, Canada Lake Association, ESSLA, LCBP, LGPC, Paradox Lake Association and Schroon Lake Association.

We identified the top three outbound destinations from each waterway in the larger Adirondack network. The map reveals sub networks of waterbodies connected by comparatively frequent connected use. Note the Northway network (Great Sacandaga-Saratoga Lake George- Schroon- Lake Champlain), the Tri Lakes network (Chateaugay- Meacham- Lake Placid-the Saranacs- Tupper), the Fulton Chain network (Stillwater-Fulton Chain-Raquette- Blue Mountain- Long), and the Speculator network (Piseco- Sacandaga-Canada- Indian). Note also the "linkage lakes" which bridge the sub networks (Chateaugay/Chazy, Tupper/Long, Blue Mountain/Indian, Stillwater, Great Sacandaga and Canada).

This information is useful when one considers hypothetical AIS spread scenarios. For example, the secondary outbound pathway, in our data set, of the Mohawk River is Great Sacandaga Lake. If AIS is introduced into Great Sacandaga Lake from the Mohawk River, the next most likely destination (GSL's primary outbound pathway) is Lake George. Lake George's tertiary outbound pathway is Lake Champlain. Lake Champlain's primary outbound pathway is Lake George, forming a circle. AIS in Lake Champlain travel via a secondary pathway to Chateaugay and Chazy Lake and hence to the Saranac Lake region. It is important to note that- represented by small numbers of visits- almost EVERY lake in the Adirondack region is connected to almost EVERY OTHER lake. What our top outbound AIS pathway map shows is the *pattern*

of pathways for the highest numbers (most likely) of outbound visits. This provides essential information when managers are making decisions about the deployment of AIS spread prevention assets across the entire region. We cannot focus on water bodies in isolation: optimization of regional spread prevention requires analysis of AIS spread vectors and pathways functioning as systemic outgrowth of repeated and predictable visitor behavior. Note that this functional network has emerged as a comparatively stable pattern in our analysis of data for each of the past three years (Figure 12). The shape and direction of the sub-networks has remained stable each year while data derived from the 2017 program expansion filled in some of the previously unknown vector/pathway network details.

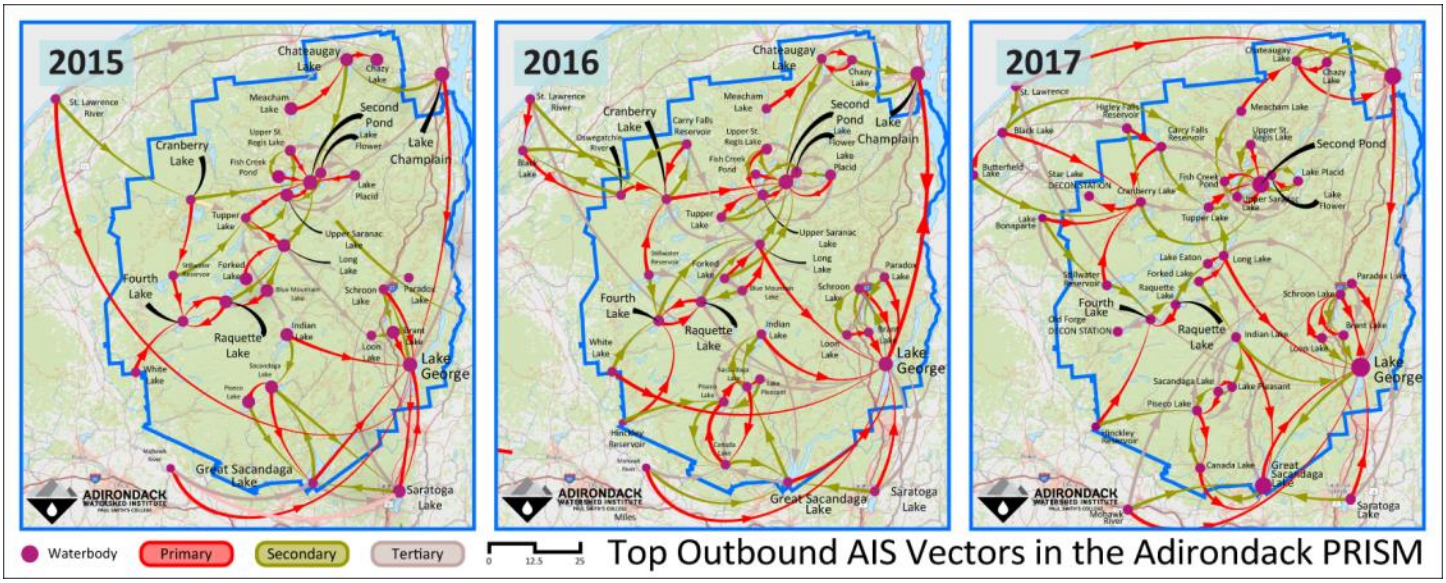

Figure 12: 2015-2017 Outbound Vector Pathway Network Comparison

We constructed a map weighing connecting vectors by *frequency* of cross-network visits, and thus ascertained relative return on investment for particular stations. Figure 13 shows the thickest (highest frequency of visits) red vector pathway arrows to and from Great Sacandaga Lake, Saratoga, Lake George and Lake Champlain, as one would expect. Thick, high traffic arrows also run to and from Schroon Lake from Lake George. Arrows are thinner (representing fewer potential transport events, a.k.a. launched boats) in the interior Adirondack waterways, corresponding to smaller totals for visits as well as generally more homogeneous previous-visit profiles. Second Pond shows a medium traffic intensity arrow from Lake Flower. The traffic-weighted vector pathway map justifies the high investment that NYSDEC has made in boat decontamination equipment around Lakes Champlain, George, and Great Sacandaga. The traffic-weighted vector map should not be employed, however, to "write off" or ignore interior Adirondack lakes, which remain vulnerable to new invasions, and worth protecting for other reasons.

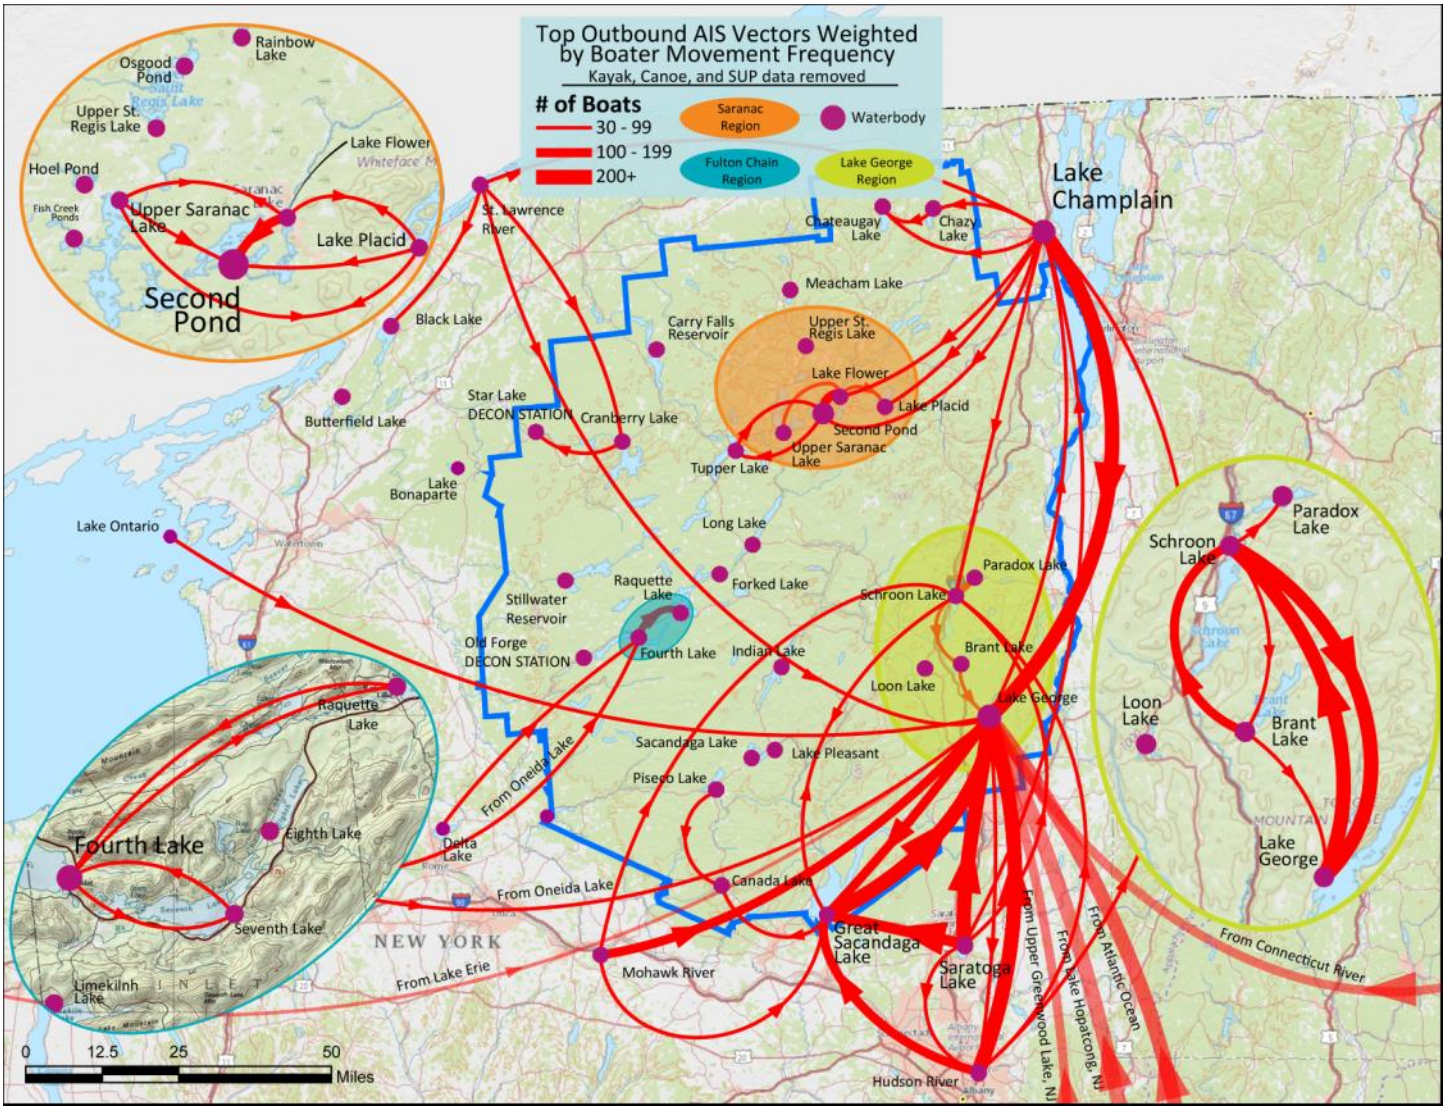

Figure 13: AIS Vectors Weighted by Number of Visits

Finally, we created a map showing the same vectors weighted by AIS presence/absence at source lakes compared to destination lakes (Figure 14). This analysis shows heavy arrows converging on Fourth Lake, indicating that several of its source lakes have AIS present, which have not been established in Fourth Lake. This illustrates how vulnerable Fourth Lake is, relative to other lakes in the network. Of course, Fourth Lake, if invaded, would then present a new risk to all the other lakes in the network to which it is connected by spread vectors. Other lakes showing particular vulnerability through this analysis include Cranberry Lake, Chateaugay Lake, Great Sacandaga Lake, Schroon Lake (from Lake George), and Lake George itself, which is vulnerable to the AIS present in the Hudson River and Lake Champlain. Lest we forget that things could get worse in Lake Champlain, the map shows it as exposed to the aquatic invaders it doesn't already have from the St. Lawrence River.

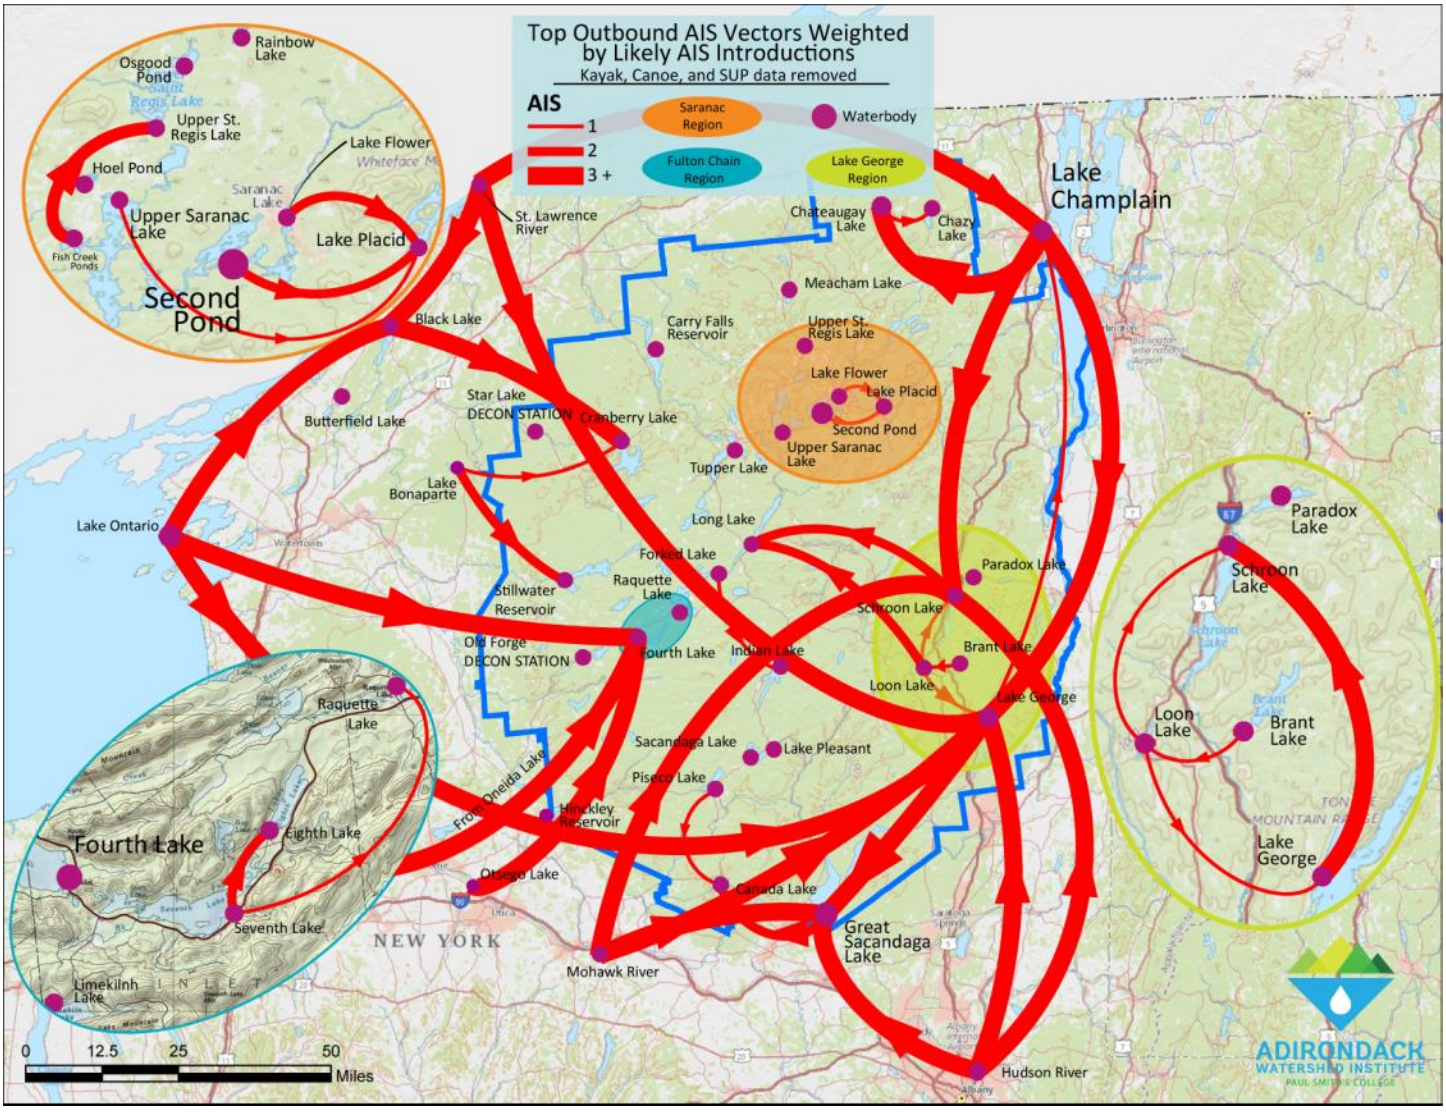

Figure 14: AIS Vectors Weighted by Likely Risk of AIS Introduction (Source Lakes vs. Destination Lakes)

Discussion and Recommendations

State agency resource managers need to make resource allocation decisions based on well-informed regional risk management with the goal of minimizing the spread of AIS. At the landscape level, resource managers cannot allocate limited resources according *only* to convenience, opportunity, preference, assumption, or public wishes. Managers recognize that each boat ramp presents a unique combination of risk, visitor use patterns, and endemic ecology. Simultaneously, we must carefully analyze the interactions between the ecology and user patterns of each of the region's waterways. Finally, we have arrived at a stage in state-wide and regional AIS invasion management where we need to begin to prioritize the pre-emption of invasions at their sources, or at the boundaries of our regional or state areas of concern. Truly, invasive species are everyone's problem, and as such, they respect no political or jurisdictional boundary. Aquatic invaders go everywhere we are free to go, impelling us to design interventions based on proactive initiatives to STOP THEM AT THEIR SOURCES. The contemporary political overtones are perhaps inevitable.

Every year, as the AWI provides services to more communities and locations, the data the program gathers becomes more complete and robust. With the acquisition of data from locations not represented in years past, the AWI was able to update and improve spread vector-pathway network maps. We have prepared single-lake inbound vector maps for most of the waterways we serve. These may be found in the Location Use Data Summaries at the end of this report. The AWI continues to integrate its own data and the

data from cooperating watercraft inspector programs, such as the LGPC, the LCBP, the ESSLA, the Loon Lake Association, and others. The composite analysis suggests that pressure from surrounding waterways continues as boaters venture into and amid the Adirondack Park Forest Preserve to recreate, fish, and paddle.

As the AWI refines the boat decontamination aspect of AIS spread prevention in the Adirondacks, the organization tailors and evolves the conservation messages it disseminates while calibrating its engagement protocols to align with updated directives from our partners in New York State agencies. The NYSDEC office of Invasive Species Coordination and APIPP provide our program with guidance based on AIS prevention data and priorities articulated by various state agencies. We anticipate NYSDEC's continued focus on decontamination of watercraft exiting waterways with small-bodied AIS present to be expanded and institutionalized throughout NYS in 2018. We also anticipate an ever-greater attention to regional level inspection and decontamination facilities being placed at or planned for the sides of major highways and travel routes both within and around the Adirondack Park, and eventually, the state.

While new and ongoing infestations command public attention, we recognize that lakes with *and* without current AIS infestations need to have continued steward coverage to detect, remove, and refer boaters based on AIS that boat inspectors encounter on watercraft. Some decontamination sites need to be strategically and/or centrally located within a convenient radius (15-20 minute drive time) to service these referrals. Thanks to the NYSDEC Adirondack program, the public now has a well-established network of decontamination stations available at convenient times and in many convenient locations. There is room, however, for increased decontamination resources in the western half of the park. The AWI uses the NYS AIS transport regulation to help the boating public understand the role that the watercraft inspection and decontamination sites play in protecting natural resources. The increasing scope of the Adirondack AIS Prevention Program offers the public with many opportunities to take environmentally responsible and logistically convenient measures to stop AIS. However, more frequent and publicized enforcement of the regulation may be necessary to encourage all members of the public to modify their behavior.

Conclusion

The AWI was able to implement, in 2017, the largest AIS spread prevention program both in its own history and in the history of the Adirondack Park. Thanks to increased leadership, collaboration, and resources provided by New York State agencies, primarily the NYSDEC, the AWI has built, with its partners in municipalities and lake associations, a spread prevention program that has attracted attention, admiration, and good-natured envy across the state. For 2018, we hope to both continue the AWI role in this regional program, and to increase our partnership and collaboration with NYSDEC, OPRHP, Cornell University's Invasive Species unit, and the other Partnerships for Regional Invasive Species Management across the state. We would like to recognize the continual collaboration and support of the Lake Champlain Basin Program, the Adirondack Lakes Alliance, and the Lake George Park Commission. These three groups are our most frequent collaborators and supporters.

Unfortunately, as invasive species continue to spread to waterways across the state and region, the integrity and quality of Adirondack lakes and rivers is becoming increasingly singular, and increasingly worthy of protection. Long-time Adirondack visitors, residents, and resource managers have recognized the importance of the integrity of Adirondack ecosystems for a century or more. Now, under contemporary threats of climate change, air and water quality challenges, and competing visions of use and management, both the peril and the purity of the waterways of the Adirondacks attest to the region's importance at the state, regional, and even national levels. The AWI welcomes its role as an important part of the story of Adirondack conservation, while simultaneously working to connect with similar AIS prevention programs across the country and internationally in order to develop best, lasting management practices for the benefit of the human and non-human ecosystem dimensions.

Program Discussion and Conclusion

Jeffrey Sann, Program Manager, with Eric Holmlund, Director,
Adirondack Watershed Institute Stewardship Program

Great Lakes Restoration Initiative: Lake Ontario Headwaters Watercraft Inspection Program

Introduction

Eastern Lake Ontario watersheds provide valuable ecosystem services and habitat for wildlife species, fisheries and coastal communities. They also are regarded as some of the most significant natural resources of New York State. Thanks to the Great Lakes Restoration Initiative (GLRI) and funding allocated through the Environmental Protection Agency and the U.S. Fish and Wildlife Service, the AWI has been able to provide watercraft inspection and AIS spread prevention in the headwaters of Lake Ontario since 2011. The 2017 effort included coverage in the Black River, Oswegatchie River and Raquette River watersheds.

Steward Karen Allen educates boaters at Cranberry Lake.

The GLRI represents a commitment made in 2010 by President Obama to invest in restoring the irreplaceable freshwater resources of the Great Lakes. Invasive species threaten ecosystems by outcompeting native species for habitat, and ultimately disrupt the flow of energy through food webs. As habitat and ecosystem restoration efforts are expanded in the Great Lakes, prevention of new infestations into these watersheds becomes increasingly critical. Preventing the spread of AIS in the headwater regions of the Great Lakes provides protection for each respective watershed as well as that of Lake Ontario and the interconnected Great Lakes- St. Lawrence Seaway system. Preventing an infestation upstream protects ecosystems at all levels in a watershed. By intercepting AIS at the headwaters, we eliminate threats that could potentially move downstream to infest high priority resources such as riparian areas and coastal wetlands.

Watershed stewards provide courtesy boat inspections, and information regarding the threat of AIS to waterway users in attempt to encourage them to adopt new behaviors when transporting their vessels between waterways. Stewards also provide outreach and attend community events to spread the message of AIS awareness and spread prevention at locations other than the boat launch. Stewards and other AWI staff attend community and inter-agency events and workgroup meetings throughout the summer and other times of the year to network and collaborate with partners in the Great Lakes watershed. A complete list of outreach and meetings attended is included Appendix B of this document.

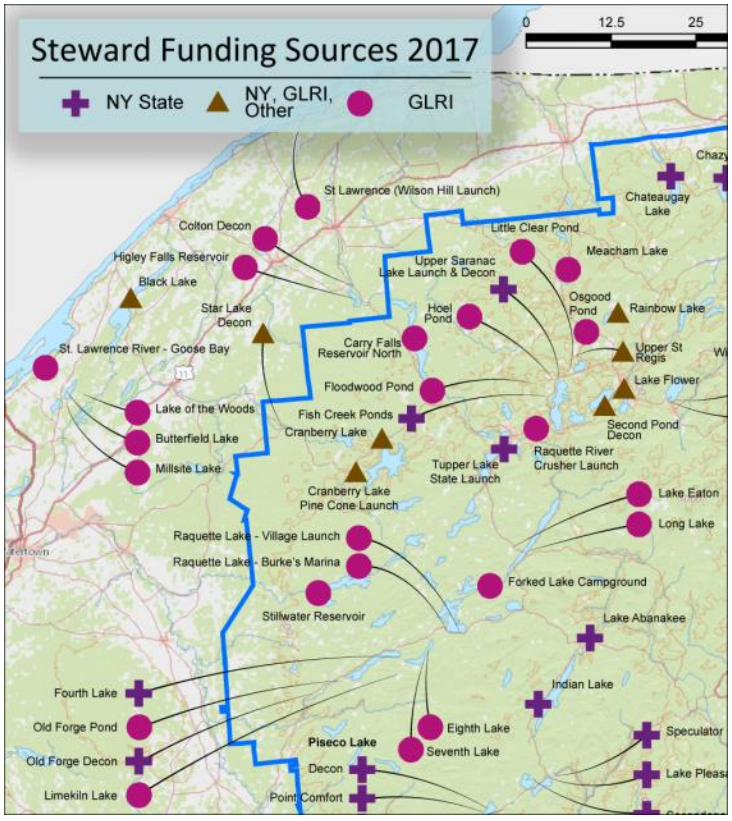

Figure 15. 2017 GLRI funded watercraft inspection locations noted by pink circles.

2017 GLRI Review

During the 2017 season, the AWI continued thorough coverage in Great Lakes watersheds with steward locations and vessel decontamination stations. 2017 also featured stewarding at locations which were previously not serviced by AWI. Expanded coverage hours at familiar sites was made possible with local lake associations receiving funds through New York State's AIS Spread Prevention Program. The message of the AWI continued to reach new and familiar users in hopes to encourage positive changes in AIS spread prevention behavior. Stewards worked to inform Adirondack communities and visitors about the threat that AIS pose to ecosystems, fisheries, recreation and the local and regional economy. Some stewards were also involved in actively managing invasive species populations as part of regional initiatives to mitigate the impacts of these infestations.

Decontamination stations continued under the assistance of a New York State-funded initiative referred to as the Adirondack AIS Pilot Program, with several stations located within GLRI-supported watersheds. These sites provided high-pressure hot water decontamination service to boaters who failed to meet the New York State clean, drained, dry regulation (6 NYCRR Part 576) and also to those who requested the service as a courtesy. Regional projects like this demonstrate the AWI's ability to collaborate with state agencies, municipalities, and environmental organizations, to offer the most comprehensive and integrated AIS spread prevention program in the Adirondack Park to date.

Throughout the 2017 season, 18,497 watercrafts were observed at 25 locations funded with GLRI and partner support in Lake Ontario/St. Lawrence River watersheds (Table 12). Stewards shared the AIS prevention message with 35,968 boaters at different launches in GLRI watersheds. 2,915 organisms were detected as a result of 18,285 inspections. The percentage of dirty boats stewards encountered at GLRI sites was 10.7% (Table 13). The AWI defines "dirty boats" as boats that pose a high risk to transport AIS because they failed to meet the clean, drain, dry standard. Organisms present on the hull or trailer, standing water in bilges and live wells are a few examples of instances that would result in a boat classified a boat as "dirty." Watercrafts were more likely to be found with organisms upon leaving waterways. Stewards found organisms on a high percentage of watercrafts at Goose Bay on the St. Lawrence River, Osgood Pond, Wilson Hill on the St. Lawrence River, Black Lake, and Butterfield Lake. Stewards found comparatively fewer organisms on watercrafts at Carry Falls Reservoir, Higley Flow, Stillwater Reservoir, and Cranberry Lake. Site characteristics (weed beds close to the boat launch) contributed to this discrepancy.

Stewards found and removed a variety of organisms from boats at the GLRI funded locations. Black Lake produced the most confirmed AIS (131), followed by Raquette Lake (34), Goose Bay on the St. Lawrence River (25), Star Lake Decontamination Station (22), and Long Lake (17) (Table 14). The percentage of boats arriving to launch with organisms present in GLRI regions was 10.7%, which is close to the AWI program-wide average of 10.9%. However, 1.3% of GLRI region vessels were transporting confirmed AIS, which is less than the program wide total of 3.3%.

Stewards asked each visitor group whether they had taken AIS spread prevention measures prior to arrival (Table 15). 67% of groups gave responses demonstrating AIS spread prevention awareness. There was comparatively large variability in visitor adoption of active spread prevention behavior between sites, which suggests segmentation of user groups by location. Inspecting and washing boats prior to launching were the two most frequently reported spread prevention measures, followed by draining the bilge of the watercraft. Please refer to the Summary of Results earlier in this report and the Location Summaries at the report's end for further presentation and discussion of GLRI data.

Looking Forward

The AWI continues to grow and expand program coverage by combining and coordinating several sources of funding. As a result, the volume and complexity of management, logistics and data collection functions were again at an all-time high in the 2017 field season. In the future, we anticipate reaching the users at all of our program locations with increasing efficacy and frequency. We have learned that frequent communication, from the program director down through the stewards, is crucial and standardized weekly staff meetings enhance staff effectiveness and morale. We learned that previous experience in our program is a crucial qualification when hiring our regional supervisors. There are many aspects and functions of the supervisor position which are specific to the AWI.

In the spring of 2017, AWI staff screened and hired more seasonal employees than ever before. The staff intake process included addressing staff challenges such as locating housing, encouraging candidates to accept positions in more remote locations, and finding candidates with communication skills, dedication, and maturity to deliver the program message. GLRI locations are typically more remote than our other locations and generally require substantial effort to locate housing for our staff. However, our continued presence in these regions has made this issue easier to overcome. As AIS awareness grows in the communities served by the AWI GLRI award, we have seen an increase in demand for the services our program offers. Members of various lake associations are noting the presence of AWI stewards at the highly visited NYSDEC boat launches, and then contact us, requesting our boat inspectors at their home lakes. We hope to answer this demand by continuing and adding to our stewarded locations so as to promote AIS spread prevention awareness across the upper Lake Ontario watershed.

Variable-leaf milfoil at Fish Creek Ponds.

As AWI has reached the 7-year mark of working in GLRI-served locations, we have witnessed increasing community acceptance and support each year. Previous relationships with state agencies, lake associations, outfitters, marinas and other local businesses have become stronger and new relationships continue to blossom. AWI is pleased to offer services in these regions that preserve the native ecosystems and waterways that help these communities and economies to flourish.

AWI enjoyed another successful summer in the Great Lakes and St. Lawrence River watersheds, and is currently working with an expanding number of partners, including New York State Parks and the St. Lawrence-Eastern Lake Ontario PRISM to make future summers of AIS awareness and prevention a certainty at new launches in GLRI regions. As our message of awareness and prevention continues to be presented to new and growing user groups, we seek to enhance community and public stewardship of our lakes and waterways. Stewards will continue to work diligently in hopes of instilling a passion for respecting our world-class freshwater resources.

2017 Adirondack AIS Spread Prevention Program

Steward Tiger Smith decontaminating a boat at the Lake Placid Decontamination Station.

Introduction

In 2017, NYSDEC contracted with AWI for a third consecutive year to manage and staff watercraft inspection/decontamination stations throughout the Adirondack Park. In 2015, the AWI successfully piloted the Adirondack Park Aquatic Invasive Species Spread Prevention Pilot Program, the first NYSDEC-sponsored program that funded watercraft inspection and decontamination across the large geographical region of the Adirondacks. An advisory council, chaired by APIPP and made up of representatives from various stakeholder groups and municipalities, provides support and guidance to the Adirondack program. Initiated by Governor Andrew M. Cuomo, the program uses the New York State Environmental Protection Fund to support an AIS spread prevention program covering the entire Adirondack Park. Directed by the NYSDEC, the program demonstrates the commitment of New York State to support coordinated protection in the fight against AIS. Under the coordination of the Adirondack Park Invasive Plant Program's (APIPP) role as facilitator of the Adirondack Partnership for Regional Invasive Species Management (Adk PRISM), the AWI placed boat decontamination and inspection stations in strategic locations intended to interrupt the spread of AIS, especially small-bodied aquatic invasive animals such as the spiny water-flea *(Bythotrephes longimanus*).

In December of 2014, the AWI convened a meeting of agency officials, scientists, lake associations, and municipalities to determine how all stakeholders battling AIS in the Adirondacks could collaborate to increase the effectiveness of regional AIS spread prevention. The meeting incorporated the science-based recommendations of the white paper, *Boat inspection and decontamination for aquatic invasive species prevention: Recommendations for the Adirondack region*. (Johnstone, Smith, Holmlund, Modley, Debolt, Rhone 2014.) The document examines existing infestations in the park and, analyzing years of stewardship program data, identifies spread vectors based on boater usage and travel patterns. Drawing upon the white paper, meeting attendees discussed AIS risk management options, reaching a consensus that strategically situated high-pressure hot water decontamination stations with additional watercraft inspection stations would provide coordinated protection for all Adirondack waterways. The result of this discussion was the implementation of the 2015-2016 pilot program, which was modeled after the Lake George Park Commission's mandatory inspection and decontamination program.

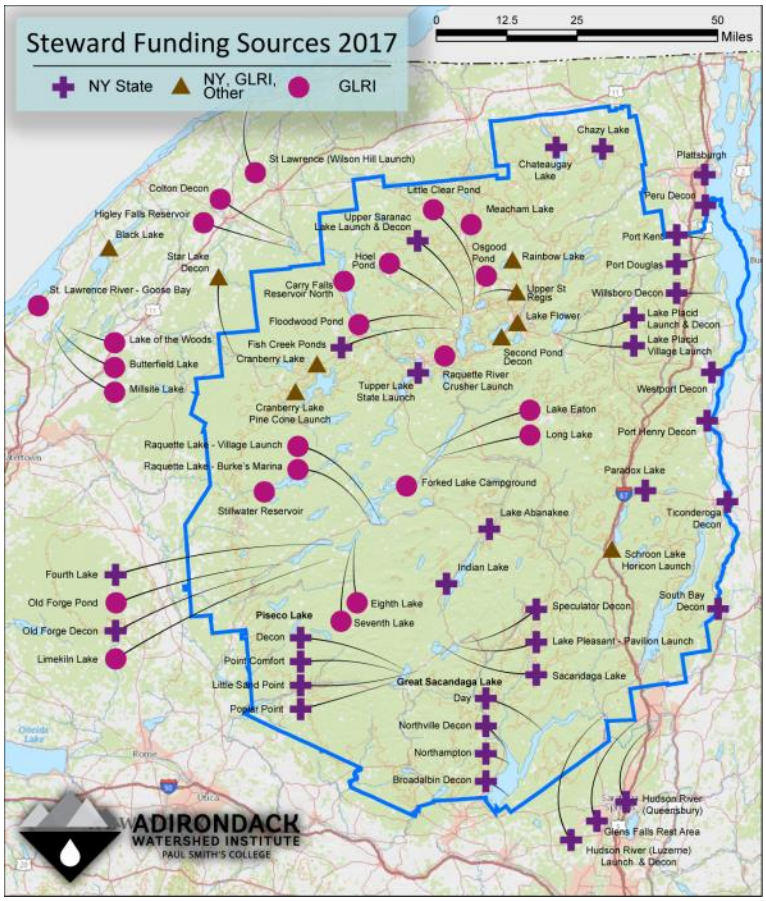

Figure 16. AWI-operated Adirondack AIS Spread Prevention Program locations, 2017. Indicated by the + sign. (Partner programs not included in figure.)

For the 2017 field season, NYSDEC adjusted the program by requiring several new locations and establishing the priority of decontaminating vessels leaving waterways with confirmed infestations of small-bodied AIS. This approach focuses decontamination efforts at launches on waterways with the greatest threat of spreading small bodied AIS and places stewards at launches to inspect, educate and refer boats to decontamination stations when necessary. Many forms of AIS can be hand-removed by stewards as they are discovered on boats. Small-bodied AIS are often suspended in standing water inside internal compartments of the vessel. AWI's decontamination services provide the additional capabilities needed to eliminate this threat, primarily through displacement via flushing and/or application of lethal heat via hot water immersion. Decontaminating upon retrieval eliminates the threat of introduction before travel to the next waterway and provides protection for virtually every other lake the boater could be traveling to. Exit decontamination achieves spread prevention for all subsequently visited lakes, regardless of the presence or absence of inspection or decontamination services.

Expanded Stewardship

The summer of 2017 continued added coverage as the result of a NYSDEC Local Grants Program in which small lake associations and municipalities were awarded funding to place stewards and decontamination sites at their lakes. The addition of these programs, coupled with the continuation of the Adirondack AIS Spread Prevention Program, resulted in the most comprehensive AIS spread prevention program in AWI history. The AWI was again tasked with disseminating its stewardship and decontamination message to regions of the Adirondack PRISM which had not been exposed to the presence and activity of watercraft inspectors.

Some locations funded by the NYSDEC and Adirondack AIS Spread Prevention Program were covered in previous years by stewards from the Lake Champlain Basin Program (LCBP). The expanded funding in 2017

provided the support needed to enhance the AWI's presence in these areas allowing LCBP to relocate its resources and provide additional coverage elsewhere in the Lake Champlain watershed. It is important to note that a number of lakes in the Adirondack AIS Spread Prevention Program and were previously served through steward programming funded by local or other partner resources.

In the spring and through the summer of 2017, the AWI hired and trained approximately 119 seasonal staff to fulfill its commitments to several AIS prevention programs including this ADK Spread Prevention Program. AWI was also funded by two US EPA Great Lakes Restoration Initiative grants, a Lake Champlain Basin Program grant, and contracts with several lake associations and agencies. Stewardship plays a crucial role in the preservation of our natural communities and is an essential foundation of the decontamination model. Under the current voluntary parameters of the decontamination program, stewards are the first line of defense for inspections at each individual launch, their people skills and interpretive message heavily influence the use of decontamination service. Most importantly, they spread the message of prevention to each waterway user in attempt to get each user to inspect his or her vessel between launches.

Watercraft Decontamination

As in 2016, NYSDEC again provided 10 Landa MHC pressure washers and 1 Landa Environmentally Clean Operating System (ECOS) unit to be used by stewards. The ECOS unit is designed to be a self-contained trailer-mounted pressure washer that collects and filters spent wash water, and re-circulates it into a supply tank. Additional ECOS units were purchased by partners at the Loon Lake Association, ESSLA (Horicon), Lake Placid Shore Owners' Association and AWI under a contract for services at the Ticonderoga State Launch. Stewards for many of these locations were trained by AWI staff and collected data in cooperation with AWI protocol in attempt to keep data and messages consistent. AWI and its partners were able to purchase 2 additional MHC units to provide coverage at sites that were not selected in the ADK AIS Spread Prevention Program but had seen coverage under the pilot program. The Fund for Lake George supplied funding for equipment at the Second Pond Boat Launch Site (Lower Saranac Lake) and GLRI funds provided equipment at the Rt. 56 roadside location in Colton.

Steward Dave Prosser decontaminating a boat at Upper Saranac Lake.

Many of the new required sites outlined by NYSDEC were new locations which had not been previously equipped with decontamination structures. As a result, a series of site visits was required involving many agencies and stakeholders. When choosing a new site, numerous factors had to be taken into account such as: parking and queue space, runoff and infiltration of wash water, wetland delineation, traffic flow and a continuously growing demand for locations that would encourage use of decontamination upon exiting the waterway. The three types of sites were high priority boat launches, high traffic roadsides, and Adirondack Park gateway locations near the perimeter of the Adirondack Park. Gateway corridor sites attempt to service trailered watercraft on their way into the park. The permitting process that followed site identification was conducted by AWI personnel with the cooperation of personnel in NYSDEC and NYSDOT.

Because many of the sites had neither electricity nor a pressurized water supply for the pressure washers, the AWI had to develop a design to tank-feed the MHC units at remote locations. Procedures to periodically fill the supply tanks also had to be formulated and executed. Some involved partnerships with local fire departments or municipalities, other times water was pumped from adjacent water bodies into the tank using gasoline powered water transfer pumps. Site preparation or excavation was unique to the situation presented at each site. In many cases, partners such as NYSDEC and NYSDOT provided labor and materials to complete the work. Still some sites required a private contractor hired by the AWI to perform the necessary improvements. Stations were opened as they were completed which resulted in a variety of opening dates.

Zebra mussels intercepted at the Horicon Decontamination Station at Schroon Lake.

Stewards at dozens of boat launches advised boaters on decontamination station location, purpose and effectiveness. AWI and APIPP staff produced rack cards showcasing locations of new decontamination stations and funded radio advertisements featuring the message of AIS prevention. The AWI continued to maintain and update a website, adkcleanboats.org, to provide information such as location and hours of operation of stations. A billboard was rented along the I-87 corridor featuring the Clean, Drain, Dry message, and pointed the public to the website to learn more.

Existing roadside signage was modified by using overlays which would replace the negatively-perceived word “inspection” with the more neutral “wash station.” Decon stations located at boat launches also featured new signs which read “Before boating elsewhere, please have your boat washed,” which were positioned for boaters to read as they were docking their vessels upon retrieval. Smaller reproductions of the I-87 billboard were installed at stations to demonstrate the unified approach throughout the park. Feedback from staff suggests that the boating public is still becoming familiar with the decontamination aspect of the services offered by AWI.

Steward Brendan Blair at the Second Pond Decontamination Station.

The summer of 2017 marked the third consecutive summer where boat decontamination sites were present throughout the Adirondack Park, as a result boaters appeared to continue familiarizing themselves with the process. In many cases, boaters asked for their vessel to be decontaminated even after passing inspection. Boaters were provided this service unless there was a higher priority need for the technician to perform an AIS decontamination on another vessel. Many boaters wanted to utilize the resource of the boat wash to ensure their vessel would not be a vector for AIS, while others wanted to see the stations in use and learn proper measures they could take to decontaminate their vessels at home. The investment made in this

program, by all partners involved, demonstrated to the public the seriousness of the threat of AIS along with New York State's commitment to protecting Adirondack lakes and waterways.

AWI program staff has been able to develop, modify, and improve the visitor education and boat inspection elements since the program began in 2000. The paradigm continues to evolve, being adjusted by factors such as scientific research, limitations based on program size and scope and feedback from the public and partner agencies. Since the inception of the decontamination aspect of services, AWI is constantly learning and refining its practices to provide the highest level of protection and most efficient and effective spread prevention services.

Steward Jon Nielsen works on a boat crusted with thousands of zebra mussels that arrived at Old Forge Decontamination Station from Lake Ontario.

As our program reaches higher staff numbers and deploys staff further and further from AWI headquarters, we have worked with a wide range of staff abilities and willingness to perform their duties at the highest level. Though the positions we offer are comparatively well-paying and professionally fulfilling, the day-to-day work experience leaves some of our staff feeling disengaged and discouraged. Despite staff burnout, AWI staff has been able to provide high effort and staff commitment at boat launches and decontamination stations.

In order to improve staff performance program-wide, AWI adjusted its approach to steward support and supervision by mid-level regional supervisors. AWI focused the time and talents of regional supervisors on both routine and impromptu site visits of each of their staff, multiple times per week. While this has always been part of the duties of these positions, other responsibilities were removed allowing more frequent site visits by supervisors. AWI leadership made site supervision and employee mentorship the top priority in order to increase the quality of the services being offered at each program site.

A tagging system underwritten by the S.A.V.E. Lake George Partnership continued allowing the ADK AIS Pilot Program to mirror the Lake George Park Commission's use of tags. Some boaters had now been exposed to the system for one or more seasons and much of our returning staff had grown more accustomed to integrating this system to best serve the boating public at their respective launches. Location-specific orange tags were given to boaters when they were planning on returning to that same water body on their next visit. This allowed a steward to see that their boat had not been in any other waterway and thus presented no risk of transporting new AIS to the same location. If a boat arrived with an orange tag from another lake, the steward was able to identify the potential threat of AIS transport from the previous lake and perform a targeted inspection. Stewards installed green tags when boats arrived at decontamination stations and either passed the clean, drain, dry standard or failed and were decontaminated. Stewards at boat launches removed these green tags and boaters proceeded with expedited interaction with the launch steward.

Table 16. Lakes utilizing the seal system and the associated seal codes.

Boaters welcome any tool that they felt would speed up their inspection and launch process. Many took advantage of the orange tags when they were planning on launching again at the same lake at another time. The green tags were also well received by those individuals who had stopped at roadside or gateway decontamination stations and would be heading to a launch where a steward would recognize the tag and its implications.

Some boaters were opposed to tagging their boats for a number of reasons. Some refused to be tagged because they expected they would be launching at lakes without stewards there to remove the tags, or they would be launching before or after the hours typical of steward coverage. The size of the Adirondack Park and number of lakes, ponds and rivers make it difficult for staff to be at every location to remove tags when boat operators need the service. Also, many boaters launch their watercraft at times when stewards are not on duty. While the tags can be easily removed with a pair of snips or even scissors, some boaters felt that they were inconvenient. Others were opposed to the idea of numbers on the tags, which they imagined might allow their movements to be tracked and recorded.

Because the tag system was adapted from the Lake George program, which has a mandatory inspection policy and different coverage and staffing practices, there were limitations on how fully it could be implemented in the AWI, with its voluntary compliance protocol. Slight discrepancies between program protocols have been observed and mentioned by boaters to inspection staff and can cause confusion for all involved. An advantage of the tag system is that it helped stewards at the launch identify vessels that presented substantially reduced risk of transporting new AIS either because the previously visited water body was that very lake or because they had been inspected at another inspection site and either passed or were decontaminated. The AWI will continue the tag program in the 2018 season. AWI is optimistic that with repetition, users will come to expect and appreciate the tag system.

Table 16 lists the lakes covered by the AWI that were involved in the tagging system along with their identifying seal codes. Other lakes in the Adirondack region utilizing this tagging system include, Brant Lake, Horicon at Schroon Lake, Loon Lake, Paradox Lake, and Lake George.

Recommendations

The AWI anticipates vessel decontamination in the Adirondacks to continue and to aid in the development of new strategies and methods appropriate for a voluntary decontamination regime, while corresponding to the unique conditions at each boat launch location. Closely aligning the voluntary park-wide decontamination partnership with the mandatory program that is has become well established by the Lake George Park Commission should be a priority. Increased protocol uniformity among decontamination sites throughout the park will enhance effectiveness and use regardless of the agency providing the service. We suggest that wherever possible, messaging in signs and publications as well as the general

appearance of the sites should be as similar as possible to increase awareness of program identity among boaters.

2017 tested the abilities of AIS inspection staff across several programs in the Adirondacks. Human error has proven to be a limitation in the inspection and decontamination process. In 2017, there were several instances of boats arriving at AWI inspection sites with green seals indicating no AIS, but upon inspection, stewards found standing water or visible AIS. This indicates that we must continue to advocate for diligence from our staff, and consider the added security of redundant inspections. Conversely, partners have reported AWI inspected boats arriving at their boat launches with seals attached inappropriately. All of these episodes reinforce the importance of improving employee training and continued supervision.

Hydrilla from the Potomac River intercepted at Upper Saranac Lake.

Every year just before the beginning of the boating season, AWI holds an annual comprehensive training at PSC for its stewards and for many lake-steward programs throughout the Adirondacks and NYS. This training covers a broad spectrum of the typical situations stewards will encounter and how best to handle them. This general training focuses on watercraft inspection, invasive species ecology and interpretative techniques. For the 2017 season, AWI differentiated boat inspection stewards from decontamination technicians in attempt to improve performance and accountability. Both stewarding and decontamination require specified skills, some of which are interchangeable, but many of which are not. Decontamination staff and their supervisors were sent to shadow and observe the Lake George Park Commission program staff to align AWI's decontamination sites and practices as closely as possible to those implemented in Lake George. Feedback from staff leads AWI to suggest a greater emphasis on detailed, focused decontamination training involving different watercraft types to provide as much training as possible.

The number of decontamination stations continues to grow throughout the Adirondacks and much of New York State. Many local communities are finding success in funding these services through a variety of sources. To achieve success and continuity among practices, AWI recommends coordination and standardization among existing decontamination programs. AWI is committed to helping in implementation of additional sites beyond its own by sharing knowledge and resources whenever available.

Table 17. Decontamination Station opening and closing dates and total days of coverage by site; coverage varied due to staff availability. (Partner programs at bottom)

Conclusion

The threat of AIS remains immediate and evolutionary in nature. The Adirondack AIS Spread Prevention Program represents a commitment made by NYSDEC and The Governor's office, demonstrating their understanding of the AIS threat and their willingness to take action. Stewardship of our natural ecosystems, fisheries and recreation areas continues to be of great importance to shape user attitudes and to teach future generations about responsible use of these resources.

Throughout the course of each field season, the AWI administrative staff learns valuable lessons in improving program efficiency and effectiveness. The AWI was honored to continue this program and to work so closely with partners in municipalities, non-profit organizations, and state agencies. It is truly inspiring what can be achieved when partners work with a common goal and desire to make a program like this happen. We look forward to the future of this program and how it will continue to involve Adirondack communities acting on their passionate connection to their resources.

Education and Outreach

Jacqueline Howard
Education & Outreach Coordinator, Adirondack Watershed Institute Stewardship Program

AWI staff with students at Indian Lake for a Water Shield Workshop.

As the AWI continues to expand across the Adirondack Park and beyond, outreach is an increasingly important preemption strategy against the spread of aquatic invasive species. By attending community events and meetings, the AWI is able to reach a broader range of constituents to disperse its message of AIS spread prevention to multiple user groups otherwise not encountered at boat launches and decontamination sites. Outreach efforts build collaborative relationships between the program and the surrounding communities. The education and outreach coordinator planned and implement a growing list of events and programs across the region. The coordinator was assisted by program managers, regional supervisors, and watershed stewards to facilitate events that required more support. AWI staff attended 108 events, including lake association meetings and trainings, Water Shield Workshops, and a variety of other programs. For a full listing of events attended please refer to the Calendar of Events in Appendix B.

Table 18: Outreach events by type and number attended.

Type of Outreach	# of events attended
Career Fairs	10
Community Outreach Events	38
Education Workshops	17
Fishing Tournaments	13
Meetings & Conferences	30

In addition to community events and meetings, the AWI expanded environmental education efforts by participating in more events specifically organized to reach the youngest members of our communities. These events included programs at the Adirondack Experience (formerly the Adirondack Museum), science field days, and working with schools and youth groups.

Water Shield Workshops

The Water Shield Workshop is an environmental educational program designed to teach participants about the health of their local lake ecosystem and the impact of human activity. AWI staff travel with the institute's Water Shield vessel to the different lakes covered by watershed stewards, rapid response team and plant monitoring team to help the participants make connections with their home waters. The program runs through four modules, each focused on a different aspect of lake health. In module 1, participants are on the water practicing the skills of a limnologist; they learn about the history of the lake, study the plant and animal species present, and collect morphometric data for water quality. Modules 2, 3, and 4 are conducted on land. In module 2, participants study how watersheds operate through the EnviroScape® watershed model. Module 3 teaches students how to identify native and invasive plants and macroinvertebrates with the help of dichotomous keys. The fourth and final module is "How to be a Steward" where participants meet the AWI steward working at the launch and talk to them about their daily duties in watershed protection. If the site has a decontamination station, participants also observe a practice decontamination for a boat that doesn't meet the Clean Drain Dry standard. Depending on the group size, there are additional modules offered. These include "The Incredible Journey" from Project WET, which teaches the water cycle, and Invasive Species Jenga, which shows how human interactions with the environment can create more stress on the environment than the initial action.

Program Manager Jeff Sann with students on Schroon Lake.

This season the AWI ran eight Water Shield Workshops. The core team of Jackie Howard, Jake Sporn, Jeff Sann, and Jon Nielsen worked with over 190 students, teachers, and lake association members. An indoor classroom curriculum is currently in development that will allow educational programs throughout the year. This will provide year-round environment education and remove the barriers of transportation cost or lake access. Each indoor module will also have the New York State Common Core Learning Standards for Science listed for each grade, which helps teachers to meet their educational requirements for New York State.

Outreach Coordinator Jackie Howard with students on Lake Placid.

The goal of the Water Shield Workshop is to create awareness of the importance of our waterways and to instill the idea and action of stewardship for the natural environment. With the planned indoor curriculum, the AWI aims to continue building on the ideals of the Water Shield Workshop while creating new ways to understand and appreciate our shared resources.

Glens Falls Rest Area

In preparation for the planned 2018 construction of a state-of-the-art boat decontamination station at the Glens Falls I-87 rest area, stewards manned an educational table outside the restrooms to provide invasive species information. They interacted with over 2,000 visitors between June 3rd and October 1st, educating them about the threat of AIS and directing boat owners to the decontamination stations located closest to their vacation destinations.

Tabling Events

AWI staff attended 59 tabling events including career fairs, gear expos, fishing tournaments, and other education-focused events. Through these events we interacted with over 3,000 people. Refer to the Calendar of Events in Appendix B to view full information.

Participants learning to use a dynamic watershed model during a campgrounds presentation at Fish Creek Ponds.

Media Mentions

As the concern for AIS introductions increase, the media continues to cover the work of the AWI. In the 2017 season, the AWI was covered by various media outlets, including newspaper and TV media. One highlight was a segment on Mountain Lake PBS's *New York NOW* program that featured Jackie Howard discussing invasive species in Fish Creek Ponds. The media was instrumental in helping to inform the public about boat decontamination sites, stewardship, and the new regulations regarding AIS spread prevention.

Business Outreach Program

This season the AWI started its own targeted business outreach program. The goal of the new program is to reach members of the wider Adirondack community who are concerned with the health and quality of the environment, along with that of the tourism-based economies.

We need the help of every visitor and resident in the Adirondacks to stop AIS at the source, by observing the New York State regulation that requires everyone to bring their boats clean (no dirt, no weeds, no organisms), drained (no standing water), and dry whenever they use a boat launch. Although the AWI has over 100 seasonal inspectors at the most popular boat launches in the region, AWI staff can't be everywhere. We need everyone to clean and operate their boats in a way that prevents the spread of AIS. This is where businesses and organizations come in.

The AWI is working with Tom Williams from Paradox Consulting to ask leaders from the business and corporate community to use their varied resources creatively to help spread the message about AIS-free boating practices with their customers, communities, and colleagues. Through these businesses and organizations, AWI can potentially increase its reach by thousands of users of New York's waters, which helps contribute to addressing an issue that most everybody cares about, and on which most everyone agrees.

The AWI is looking for new platforms for its basic message, new methods of reaching and engaging people, and new resources to help get the word out and to better care for our lakes.

Social Media

Social media marketing has allowed us the opportunity to connect with a larger audience of people passionate about the waterways of the Adirondacks. We currently manage Facebook and Instagram accounts to engage our growing online community, which includes everyone from park natives, weekend warriors, annual visitors, local organizations, and nationwide conservation leaders.

Social media statistics:

- 400+ Newsletter subscribers
- 700+ Facebook fans
- 600+ Instagram followers

Conclusion

This season was packed with events all over the Park, allowing AWI staff to share information about environmental quality and conservation to a large number of people. As AIS continue to be a threat to lake ecology in the Adirondack Park, outreach and educational programs, including the use of social media and regular media, are an important way for increasing public awareness of the threats and impacts that AIS can have in our local watersheds. Overall, education and outreach over the 2017 stewardship season was very successful. Looking ahead to 2018, we expect to continue the growth of our environmental education program, as well as continuing to utilize social media and our business outreach program to reach as many user groups as possible.

Students playing invasive species Jenga at the Lake Placid Water Shield Workshop.

Special Project Reports

The AWI Stewardship Program's holistic approach to watershed integrity includes some value-added projects which extend the reach of the program into issues, concerns, and communities that are located away from boat launches and watercraft decontamination stations. These special projects occupy at most one day per week of steward time, and more commonly, several days dispersed over the summer season.

Invasive Species Monitoring and Management

Water Chestnut Pull

Stewards assisted with hand harvesting of water chestnut plants on July 28th at the La Chute River in Ticonderoga. This is a recurring activity to control the density of water chestnut and the first year that AWI stewards have participated due to our increased focus on the Lake Champlain region.

Asian Clam Survey

Stewards participated in the third annual volunteer Asian clam survey on Upper Saranac Lake on August 19th. Nine sites were surveyed and 800 sediment samples were sieved by all volunteers. For the third year, no Asian clams were found in Upper Saranac Lake.

Purple Loosestrife Management

This season stewards Brenden Blair and Lisa Cassidy helped APIPP's Terrestrial Invasive Species Project Coordinator Zachary Simek pull purple loosestrife (*Lythrum salicaria*) from the St. Regis Chain of Lakes. The St. Regis Chain of Lakes is comprised of three lakes: Upper St. Regis, Spitfire, and Lower St. Regis Lakes. Zack and the two stewards pulled a total of 501 plants from 13 out of the 23 total sites. There were three new sites and a potential fourth that either had purple loosestrife removed or needed future removal. The survey and pull was a continuation of yearly management of the three lakes conducted by stewards. With continued monitoring and management, stewards have been able to eradicate nine sites infested with purple loosestrife, and decrease the volume of plants at others.

Research Assistance

Loon Monitoring

The Adirondack Center for Loon Conservation is a non-profit organization with the mission of promoting the conservation of Common Loons (*Gavia immer*) in New York's Adirondack Park and beyond. Their research uses the Common Loon as an indicator species to assess the impact of environmental mercury pollution to aquatic ecosystems. Loons are highly susceptible to mercury poisoning because they consume smaller creatures that are already affected by mercury inputs from air and water pollution.

Photo credit: **Adirondack Center for Loon Conservation**

The AWISP has been contributing to loon research in the Adirondacks for 16 years. On May 28th, Dr. Nina Schoch of the Adirondack Center for Loon Conservation trained volunteers. Through classroom and field instructions, stewards learned where to locate loons, the meaning of various calls, and how to document the observation of banded and un-banded birds on data forms. Stewards were assigned to Big Moose Lake in the Central Adirondacks and the St. Regis chain of lakes in the Tri-Lakes Region. Monitoring began in June and ended in August.

Bird-Window Collisions in the Rural Landscape of the Northern Adirondacks

Stewards Emily Hill and Amanda Menard surveyed buildings on the PSC campus as part of the window strike study being conducted by Dr. Jorie Favreau of PSC. The stewards surveyed from June 3rd-21st for bird carcasses resulting from bird-window collisions. They searched 11 of the 32 buildings on campus that had windows. Bird carcass searches were conducted on these buildings by walking around the outside of each building ~ 6:30 a.m., collecting all bird carcasses found within two meters of a building. Carcasses were bagged, labeled, and placed into to a freezer for future analysis. Two ruby-throated hummingbird carcasses and three yet to be verified passerines (two were tentatively identified as a tufted titmouse and a kinglet) were collected during this period. Emily also relocated a live turkey out of the Blum Residence Hall. This data is added to the multi-year study which seeks to estimate the effects of windows on rural landscapes on bird mortality.

Lyme Disease Ecology in the North Country

In June, stewards visited numerous sites around the North Country (including Franklin, Essex, Clinton, Hamilton, Herkimer and St. Lawrence Counties) to collect host-seeking nymphal black-legged ticks. This effort provided valuable information about the density of ticks, as well as the prevalence of tick-borne pathogens in this emergent area for research being conducted by Professor of Biology, Dr. Lee Ann Sporn of Paul Smith's College.

Summit Stewarding

Summit stewarding is a great opportunity to educate hikers about Adirondack history, conservation, and responsible recreation, as well as to bring hikers up to speed about aquatic invasive species. AWI staff stewarded St. Regis Mountain and interacted with 546 visitors this season.

St. Regis Mountain

Summit stewarding is an important way to educate hikers about history, the environment and the importance of conservation. Two stewards, Carly Haralson and Ian McGuire, spent a total of eight days summit stewarding on St. Regis Mountain. Throughout the summer, stewards interacted with hundreds of visitors and helped spread the word about conservation and preservation in the Adirondacks.

St. Regis Mountain is located in the town of Santa Clara in the northern Adirondacks. The trail is a 3.3-mile ascent to the 2,874-foot summit and offers outstanding views of the St. Regis Canoe Area and the High Peaks to the south. The summit is home to a fire tower, which was built in 1918 and housed an observer. The observer lived in a cabin on the mountain and kept a watchful eye on the land, surveying for any forest fires during fire season. Due to the effectiveness of aerial and ground surveillance, the tower closed in 1990 and sat, deteriorating, on the summit. Fortunately, the Friends of St. Regis Mountain Fire Tower (FSRMFT) have worked tirelessly to restore the tower to its former glory.

Date	# of Visitors Reached

June 24, 2017	80
July 2, 2017	105
July 9, 2017	52
July 16, 2017	54
July 22, 2017	81
July 23, 2017	49
July 30, 2017	62
Total	**546**

Table 19. Number of visitors reached on St. Regis Mountain.

St. Regis Mountain Fire Tower

Restoration of the fire tower began in September of 2015 and is an on-going effort. Projects in the past have included building stairs, the cab, and railings on the tower. However, this year, AWI stewards focused on the educational component of FSRMFT's mission. Part of restoring and opening the tower meant developing an educational and interpretive program that promotes the historic and cultural values of the St. Regis Mountain Fire Tower, the NYS Fire Tower Network, and the Adirondack Forest Preserve. FSRMFT created summit cards for stewards to hand out on the summit. These Summit cards were signed and dated by the stewards, allowing hikers to keep an official record of their ascent. The summit cards were popular with younger hikers, who were thrilled to be able to return off the mountain with a card acknowledging their climb. Tower stewards also educated hikers on Leave-No-Trace Ethics, promoting good stewardship of the land.

Location Use Data Summaries

Black Lake, Goose Bay (St. Lawrence River) and Indian River Lakes

AIS intercepted: 164
Boats inspected: 2,431
Number of visitors: 5,339
Boats failing inspection: 27.7%
